

Lesson 2: Designing Graphs to Enlighten

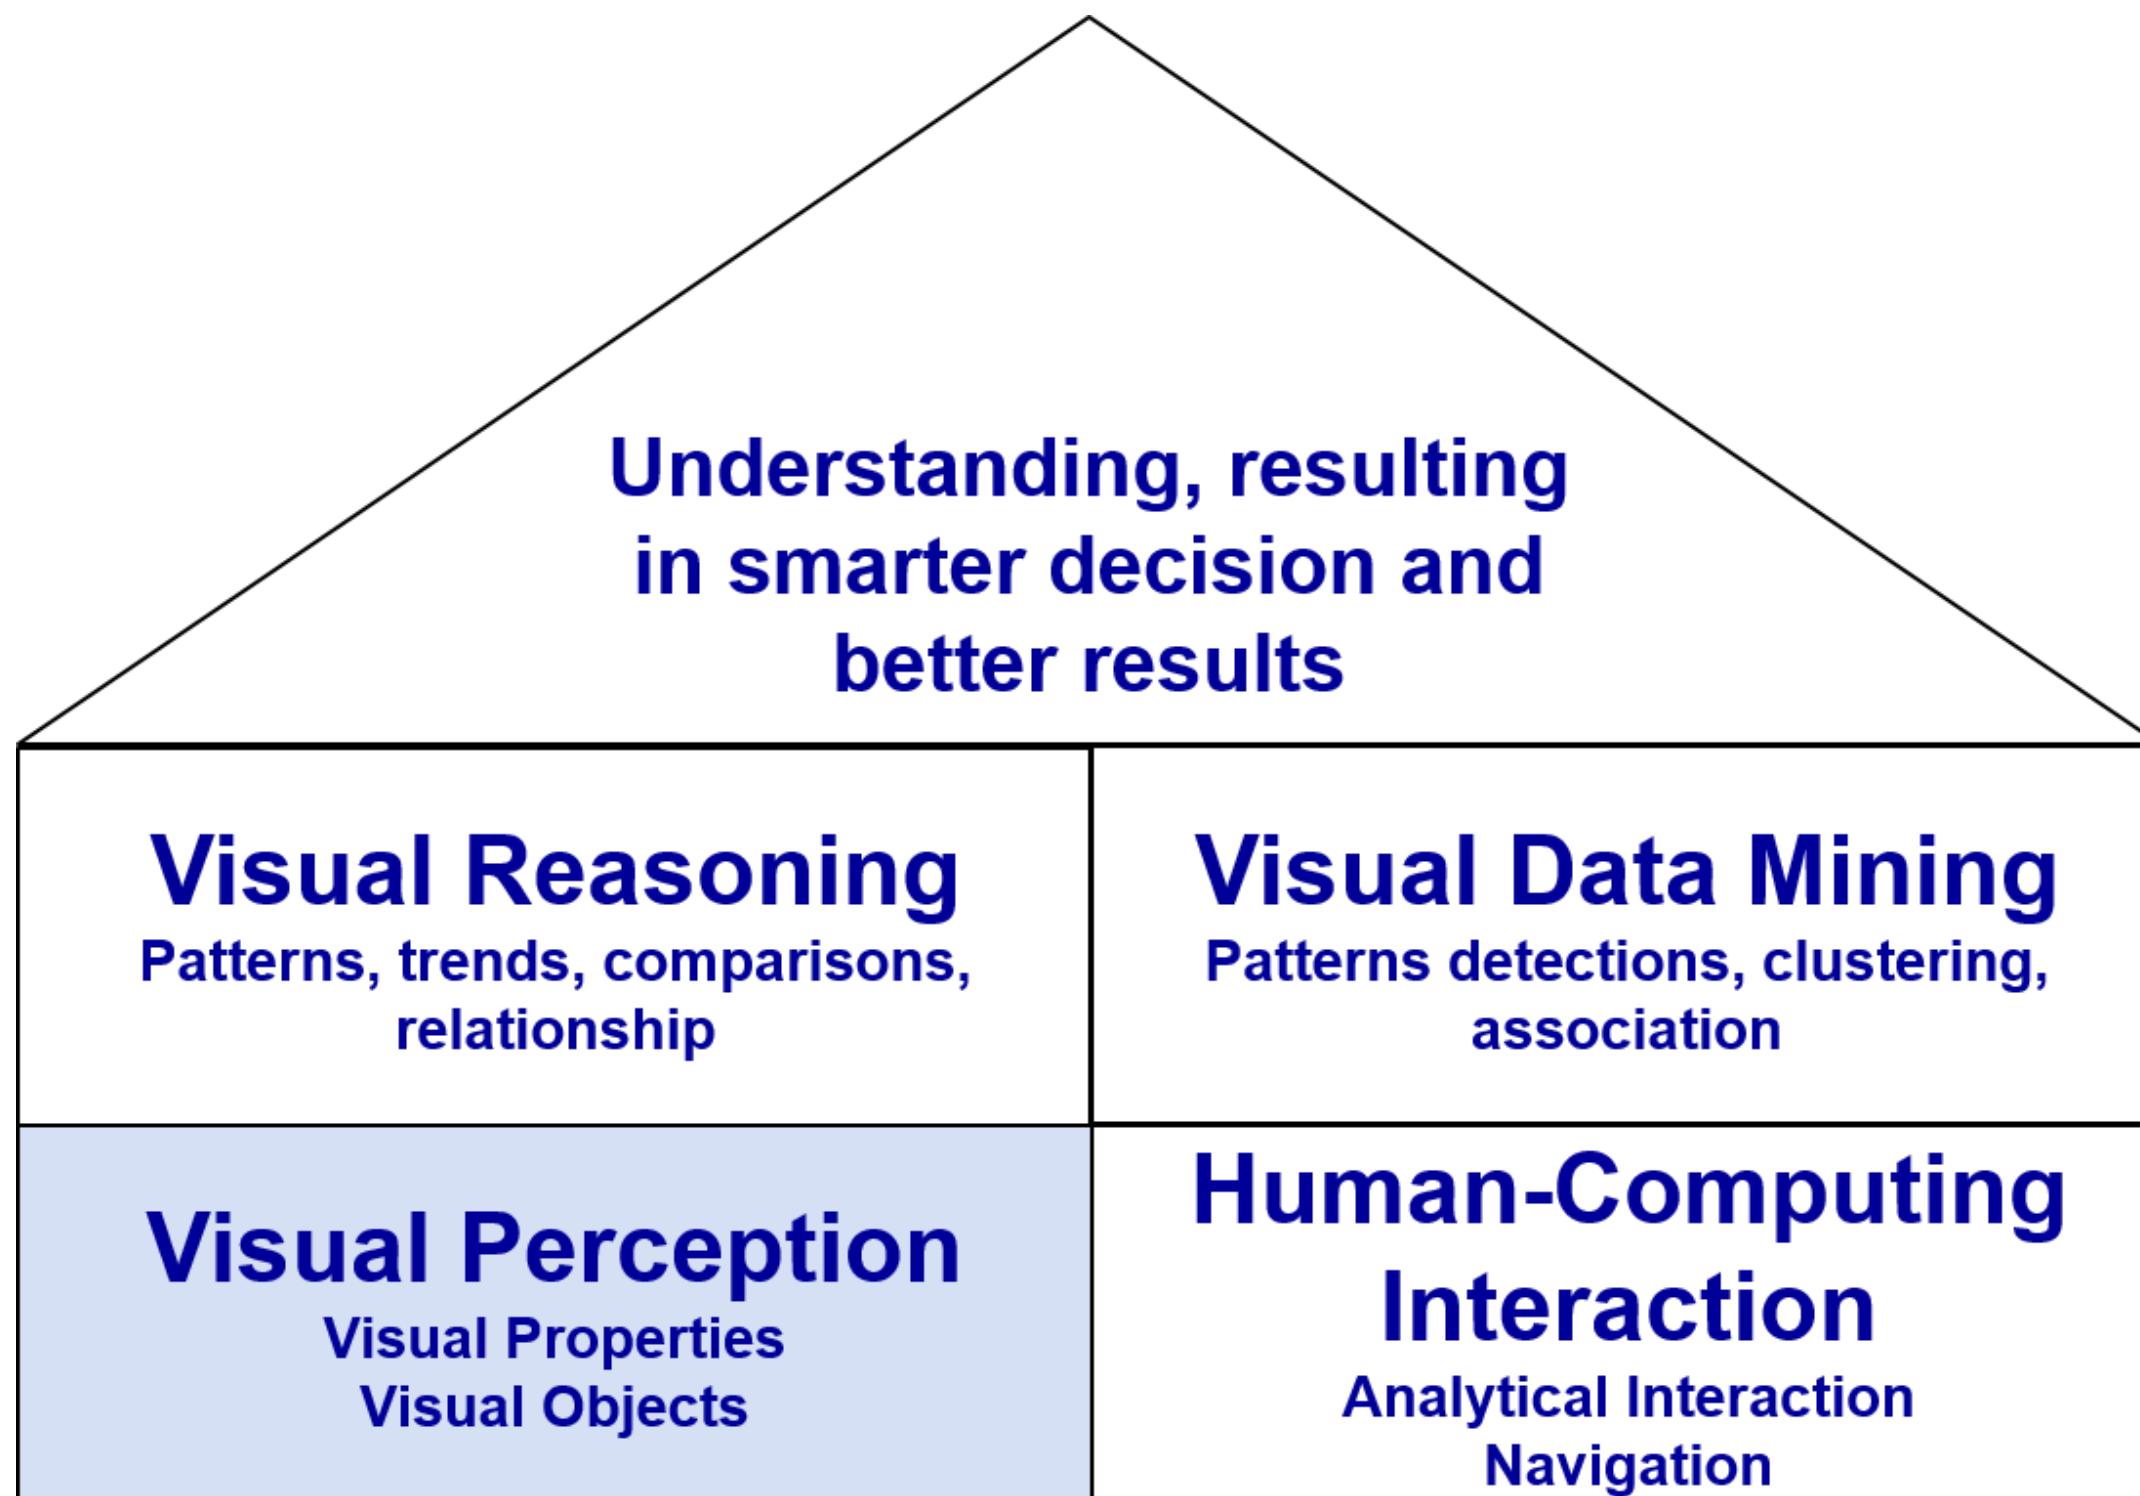

Dr. Kam Tin Seong
Assoc. Professor of Information Systems (Practice)
School of Computing and Information Systems,
Singapore Management University

14 Apr 2023

What will you learn from this lesson?

- Data visualisation design process
- The Devil is in the data
- Human perception and information processing
- Components of a graph
- Principles and practical guides for data visualisation design
- Data visualisation critics framework

Building Block of Visual Analytics

DataVis design process

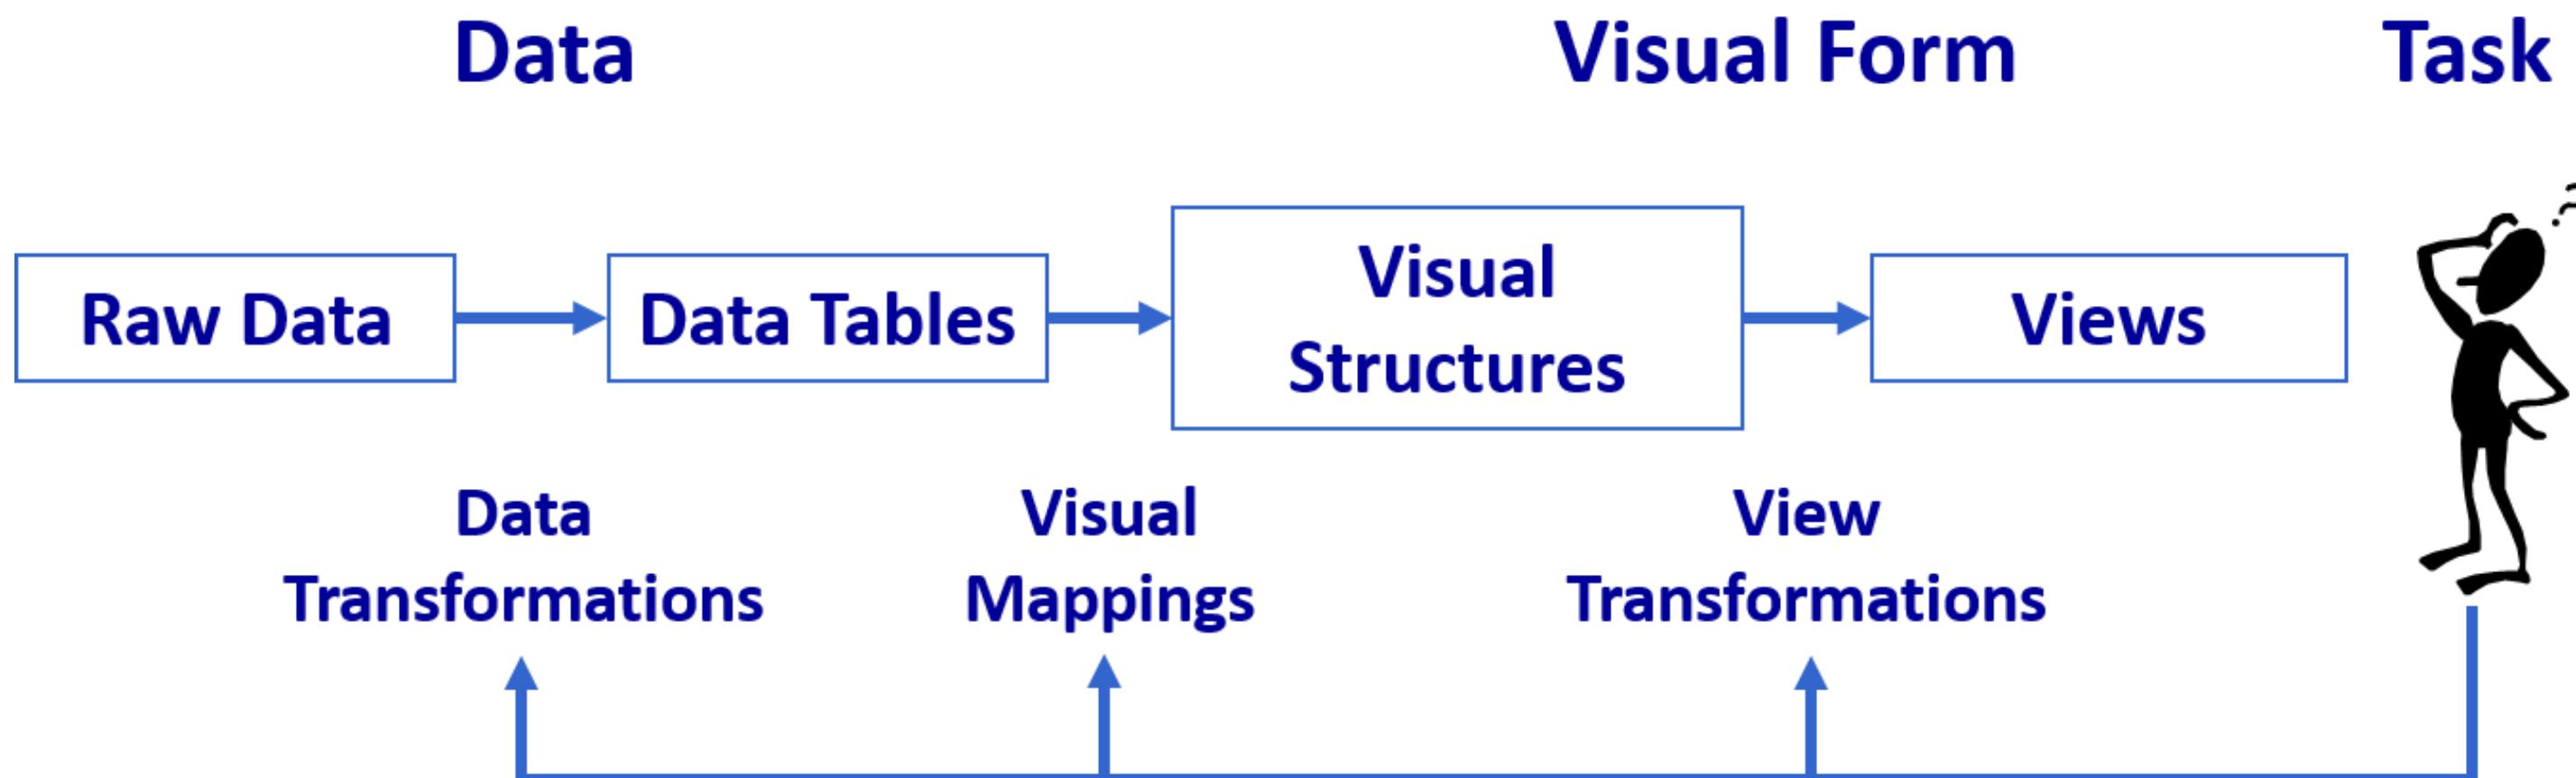

- Start with a clear message
- Select the right data
- Use the right visualisations
- Express and explain
- Review and seek feedback from experts and casual readers

DataViz design process: Start with a clear message

Data Management
Select data source
Clean data
Categorise data
Moderate data

Visualisation
Information design
Visual encoding
Interface design

Visual Analytics
Observations
Hypothesis
Evidence (+/-)
Summarise
Communicate

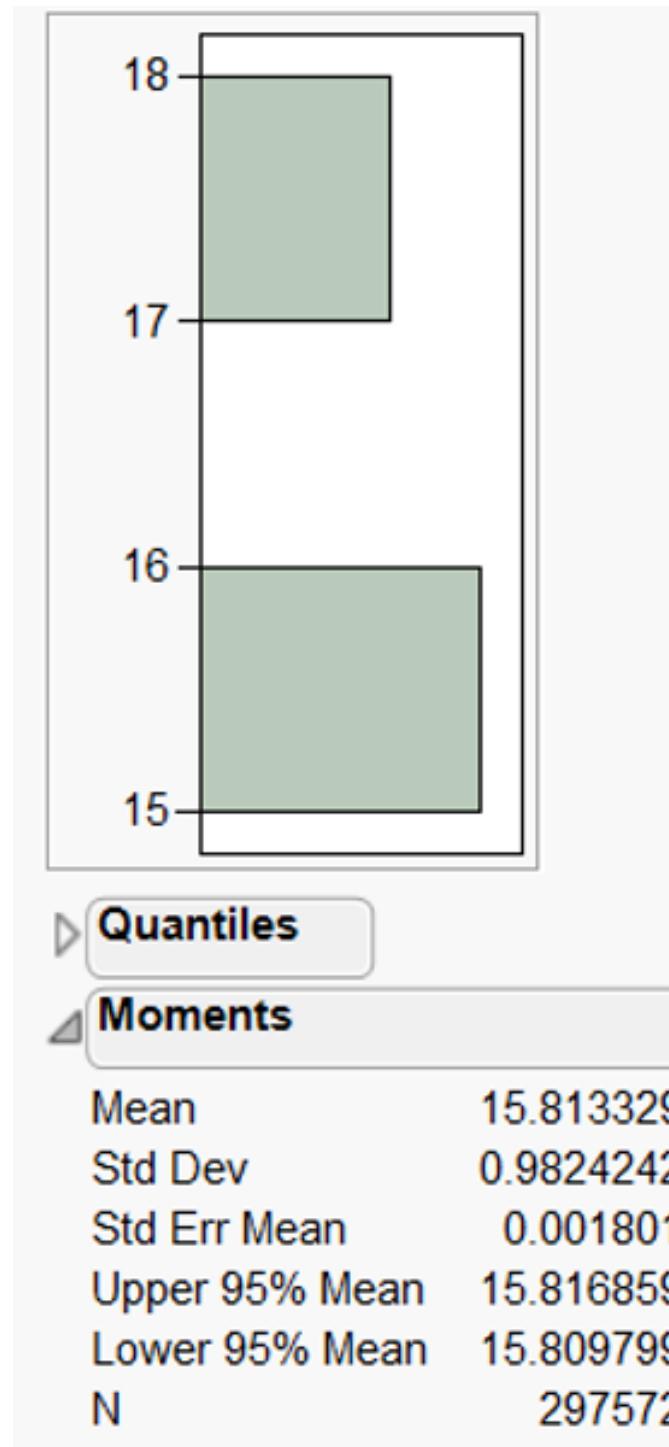

The Devil is in the Data

Numbers Worth Knowing

Not all numerical data are continuous!

Visualising the Right Data

- There are more than one way to present the data.

FIVE DATA VARIATIONS TO CONSIDER

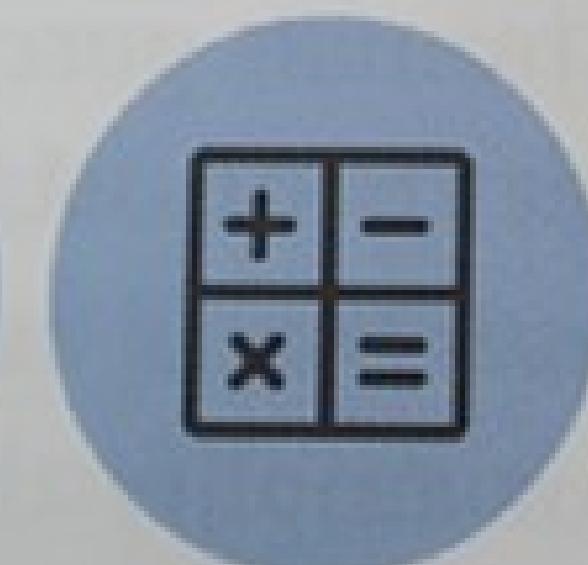

Totals

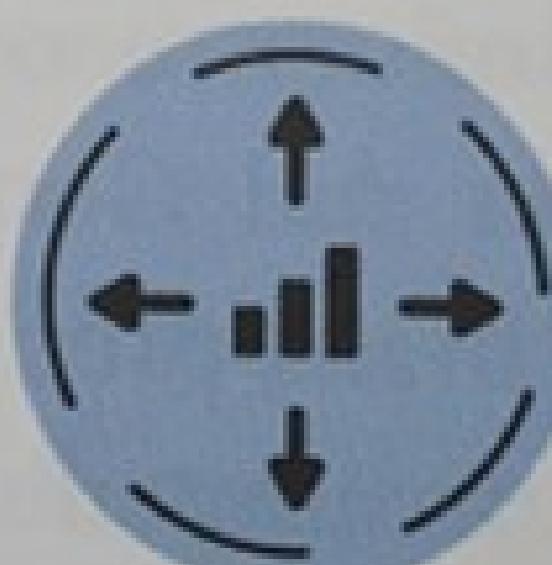

% Change

Calculated Metric (Ratio)

Added Context

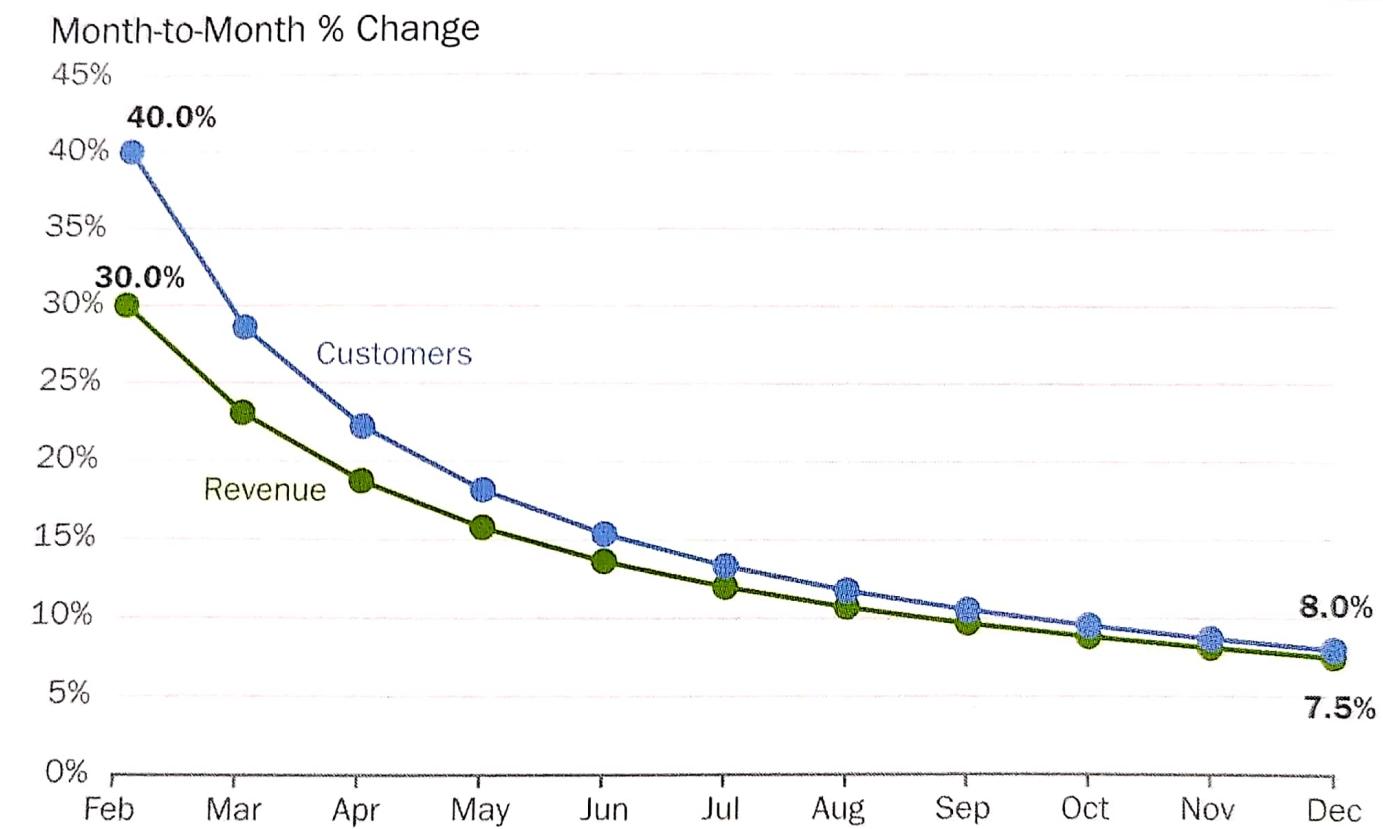

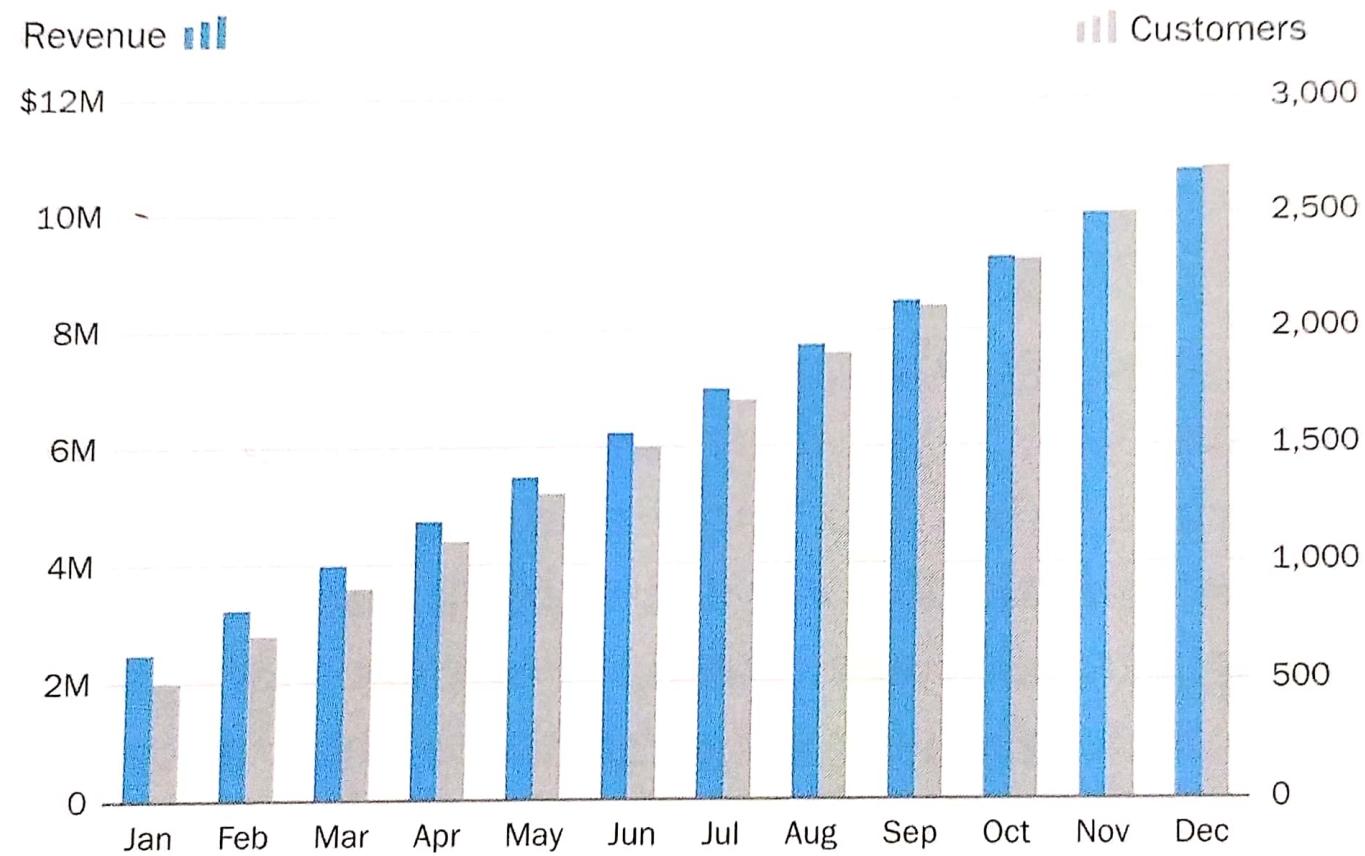

Variance

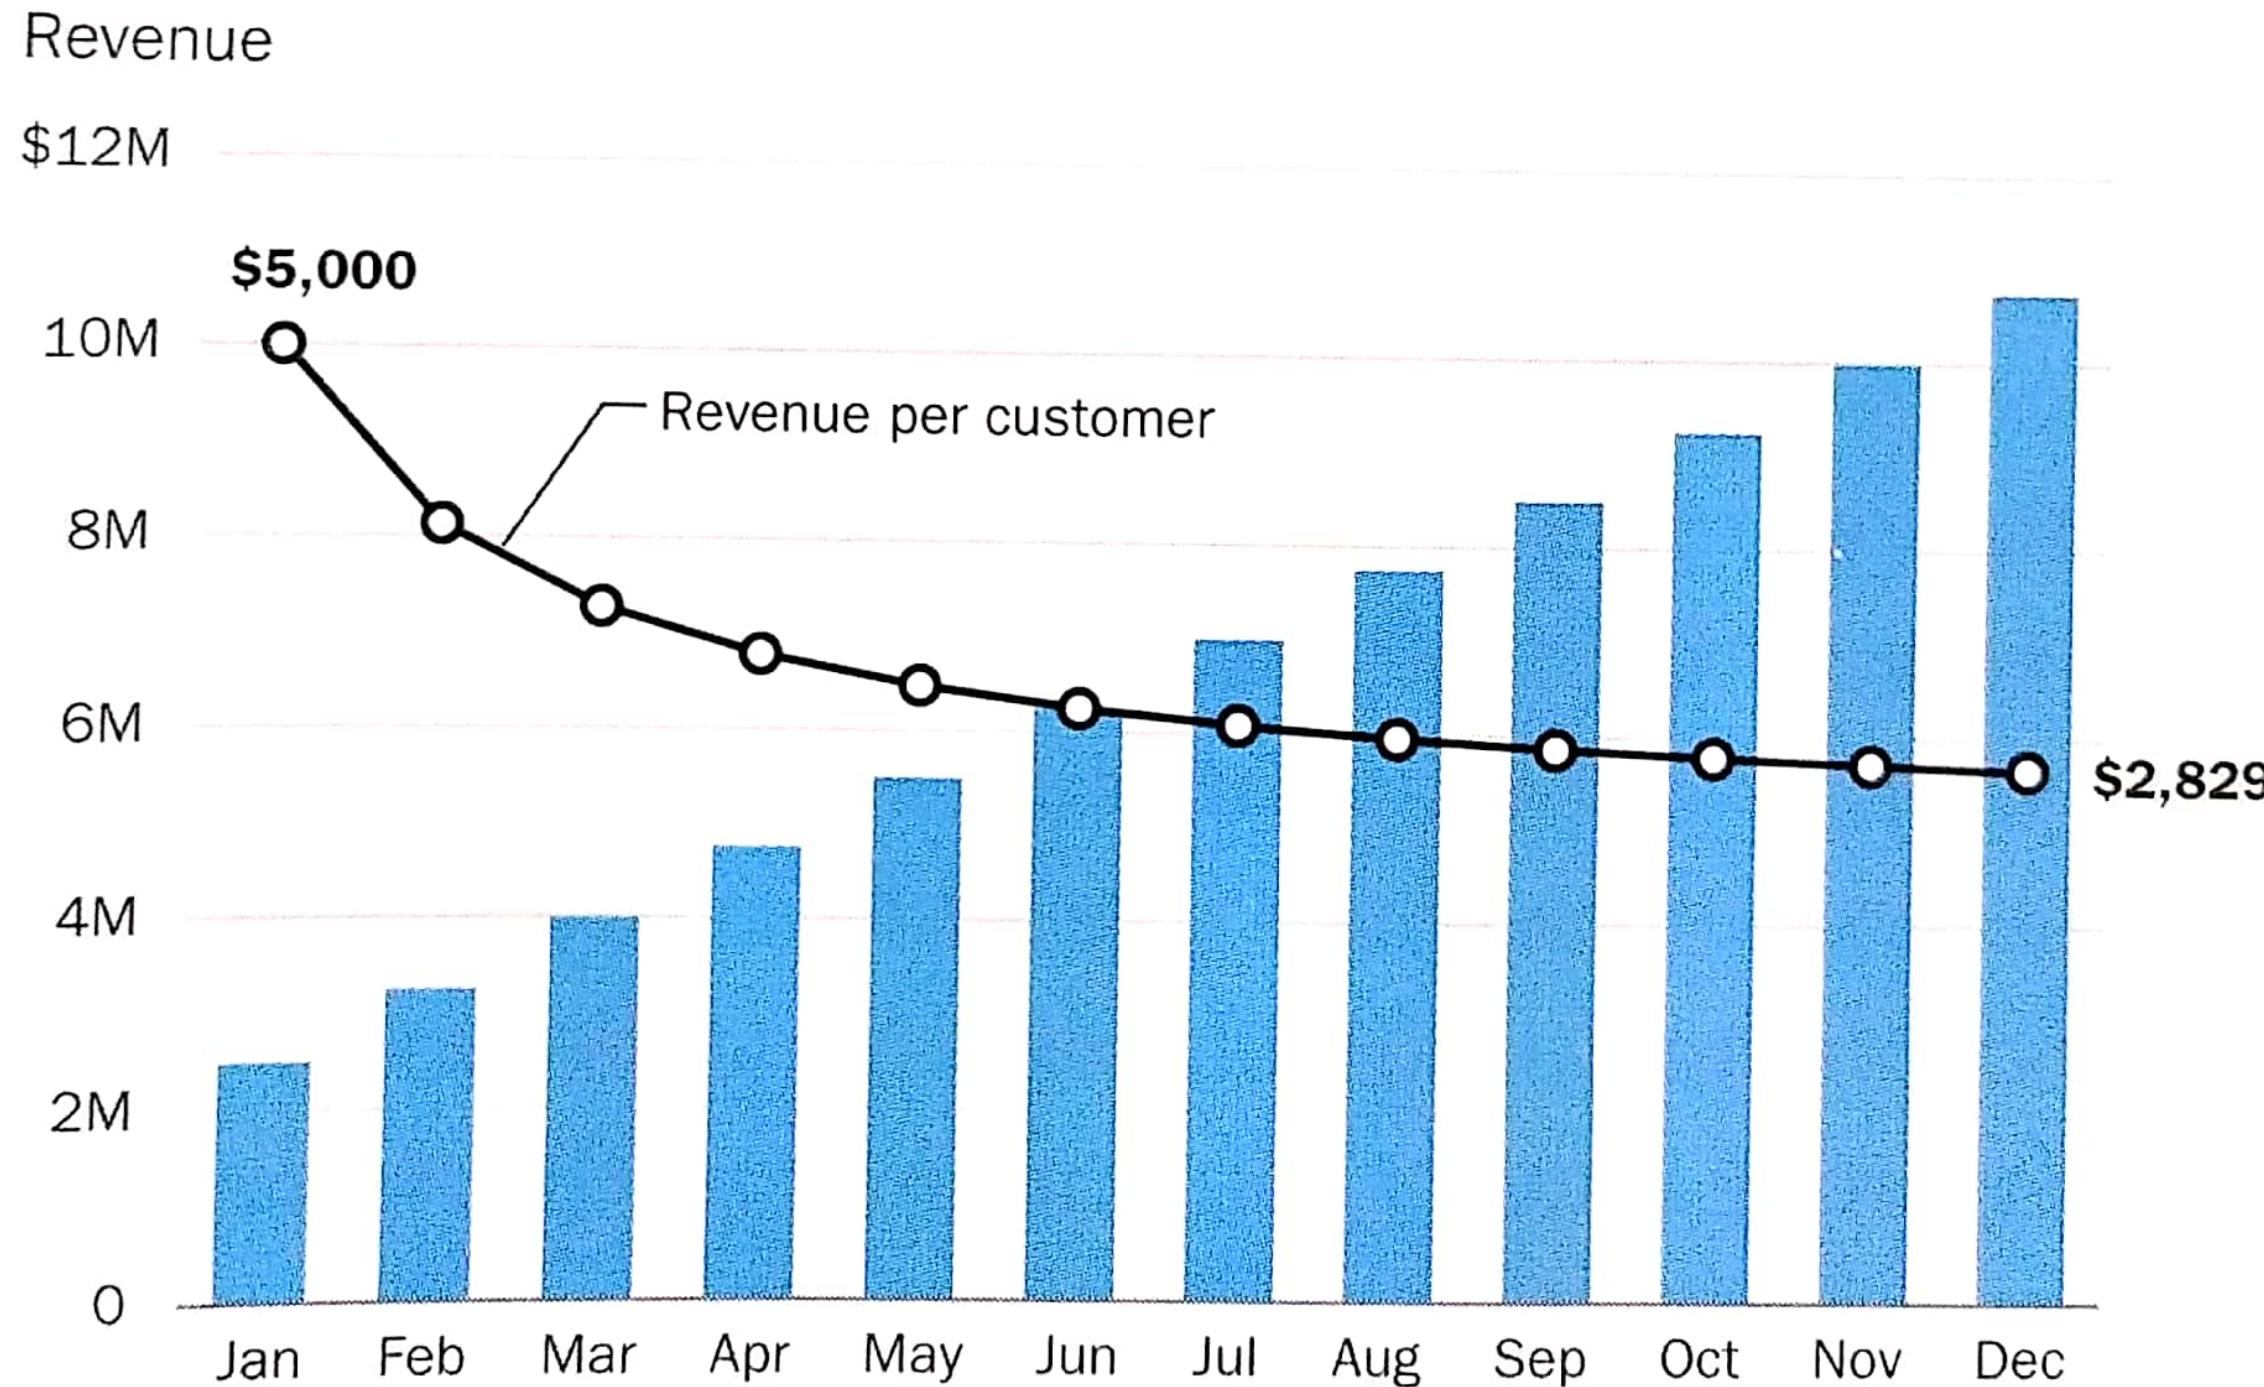

Visualising the Right Data

- Derived values reveal more interesting patterns than absolute values.

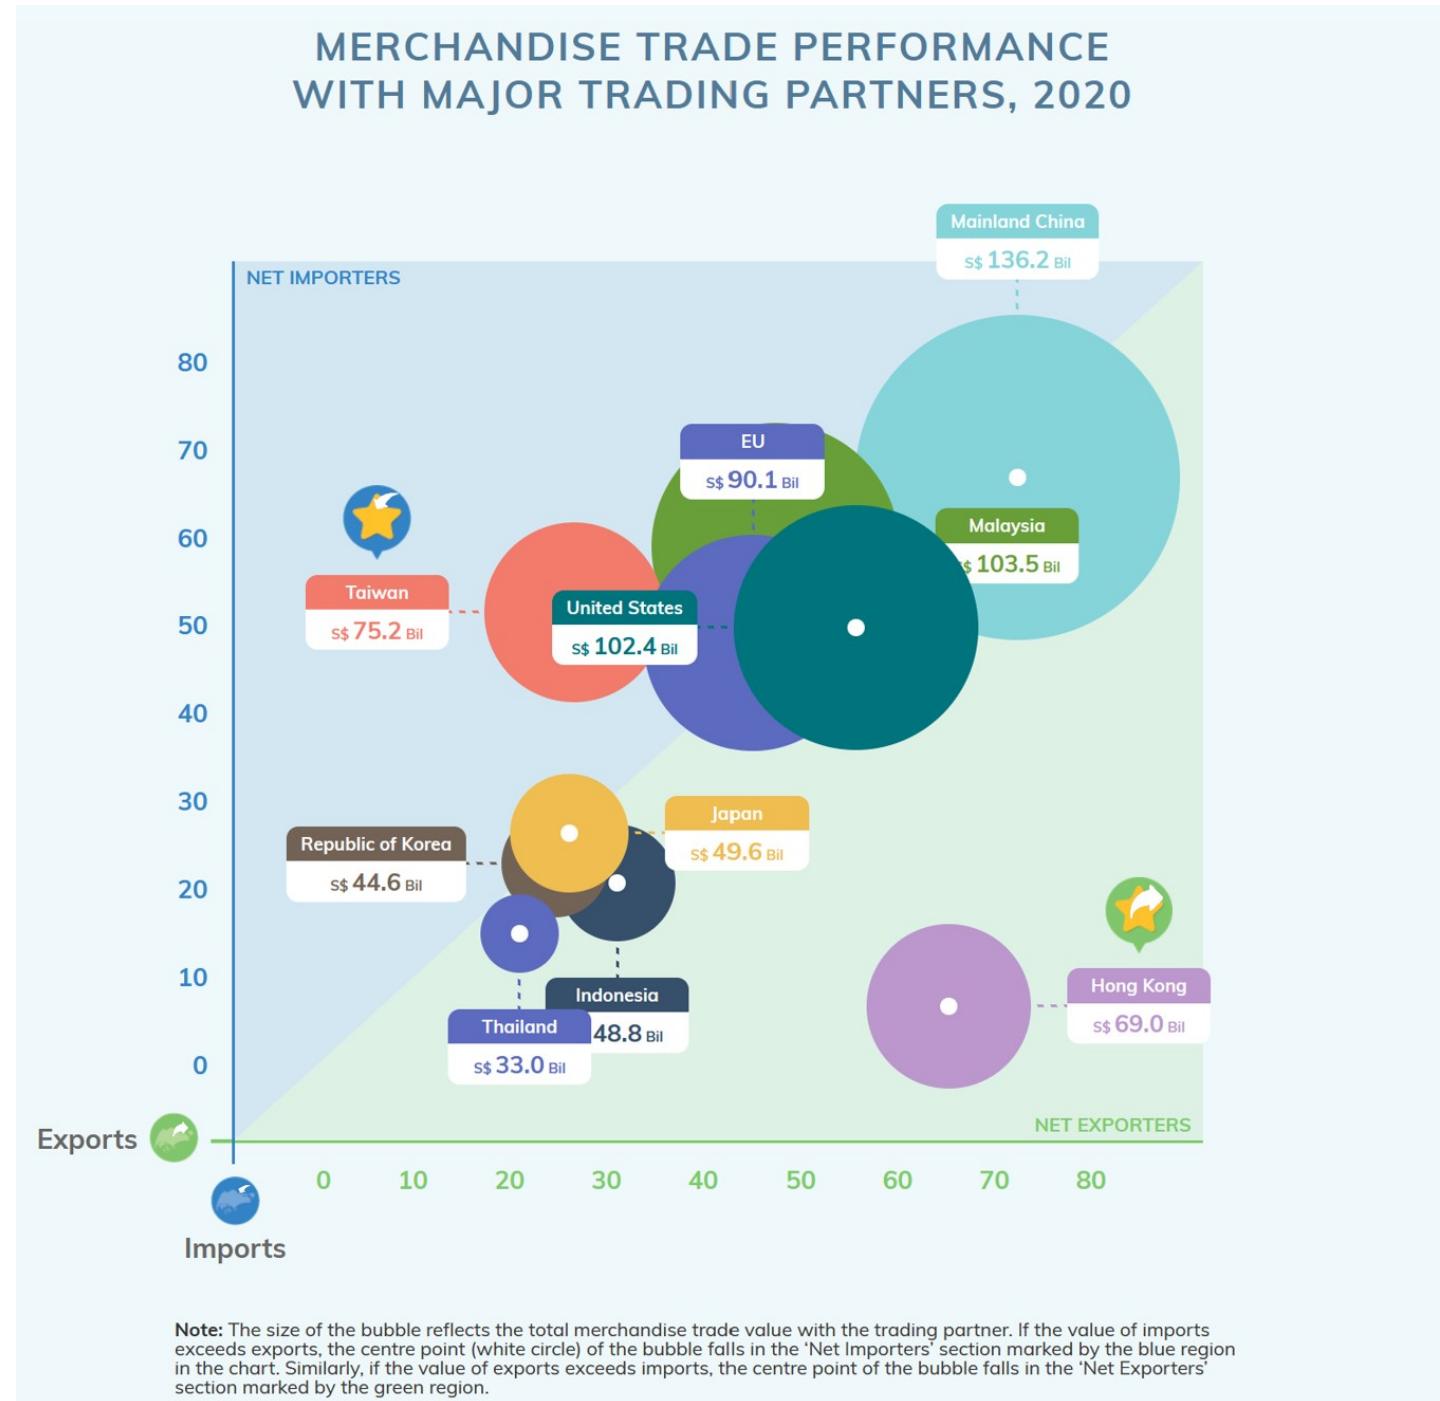

Visualising the Right Data

- Derived values reveal more interesting patterns than absolute values.

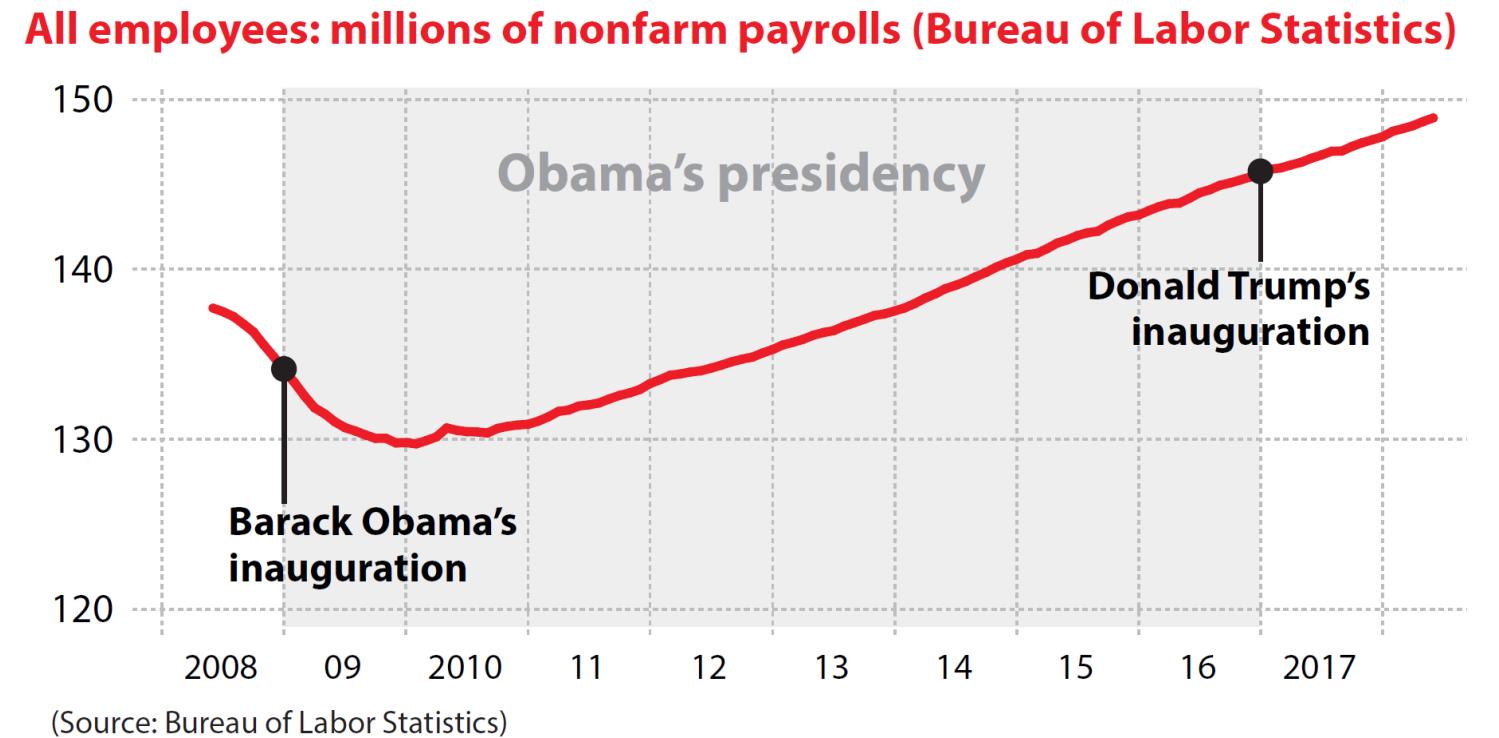

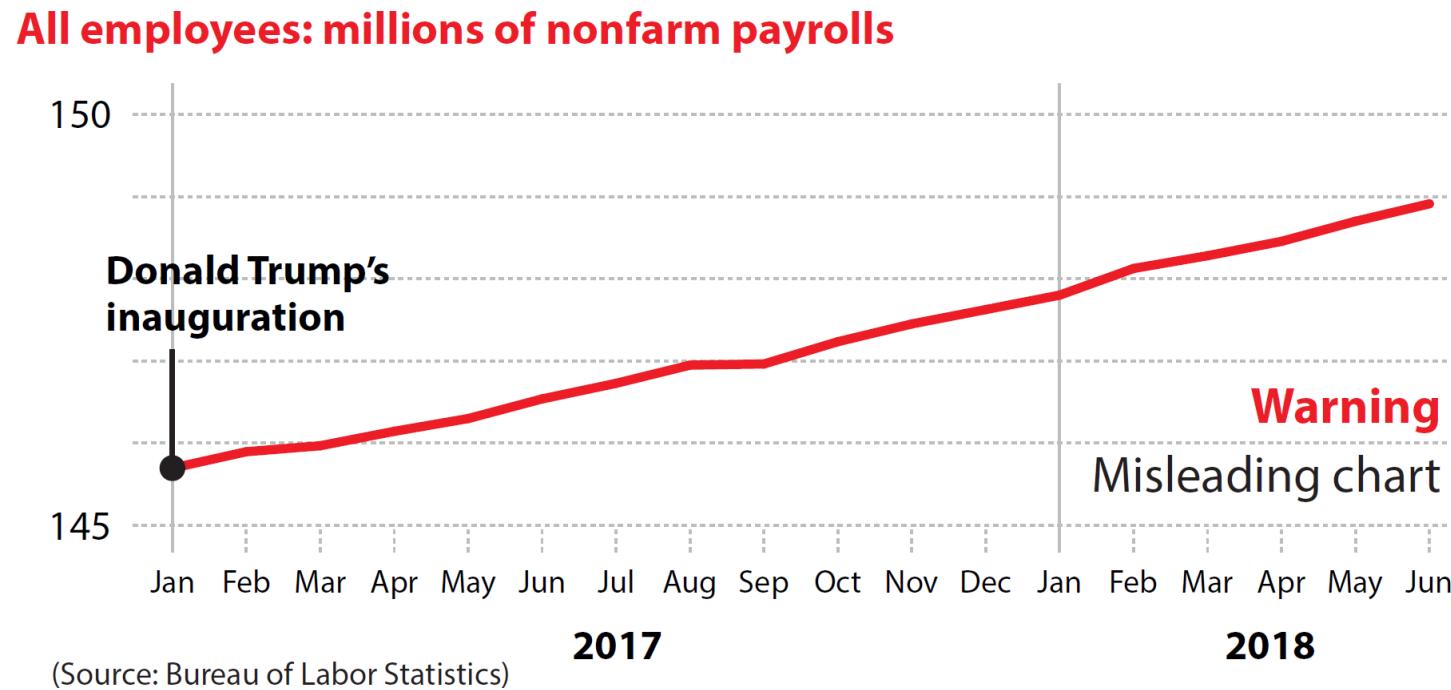

Graphical Integrity: Show Me the Truth

Source: Department of Statistics

Graphical Integrity: Show Me the Truth

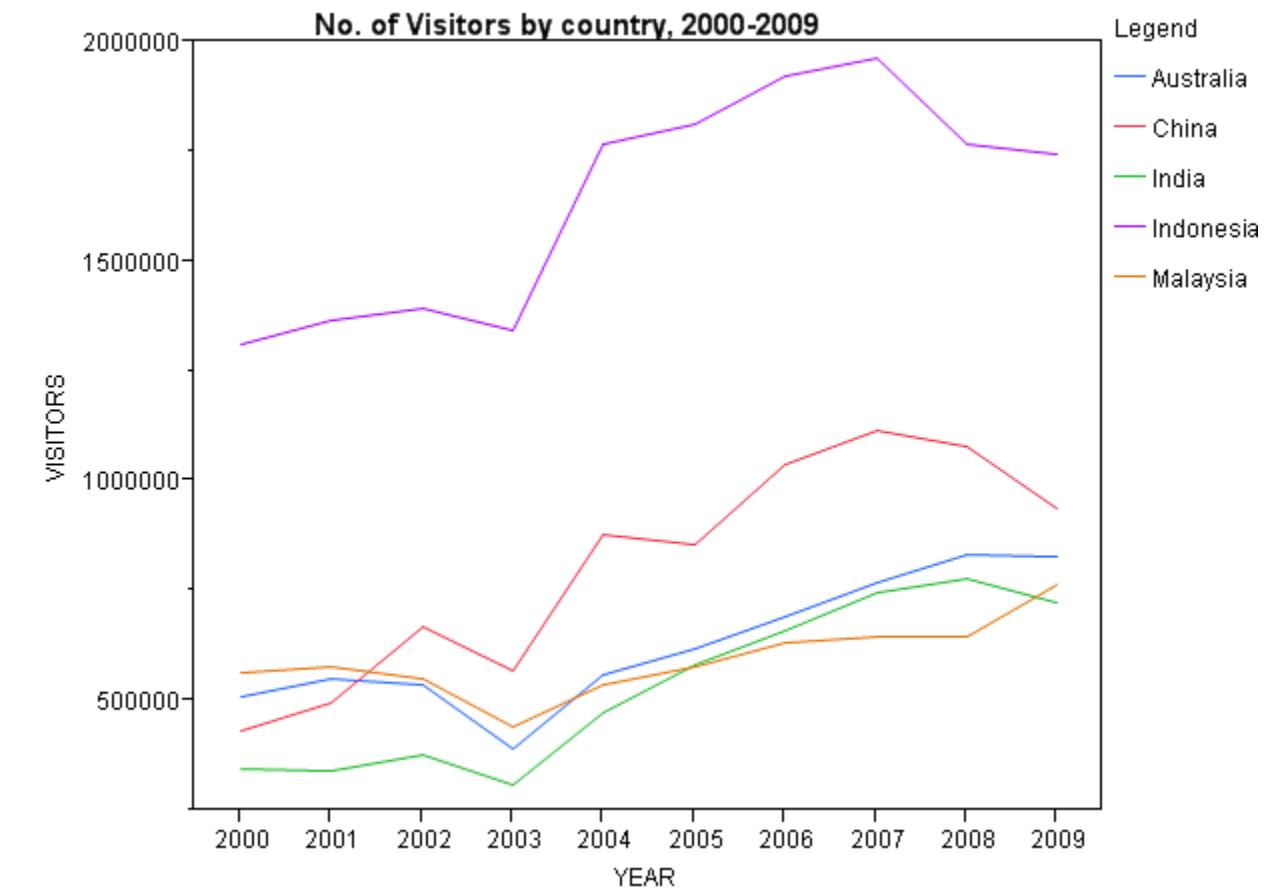

Snapshot can be misleading!

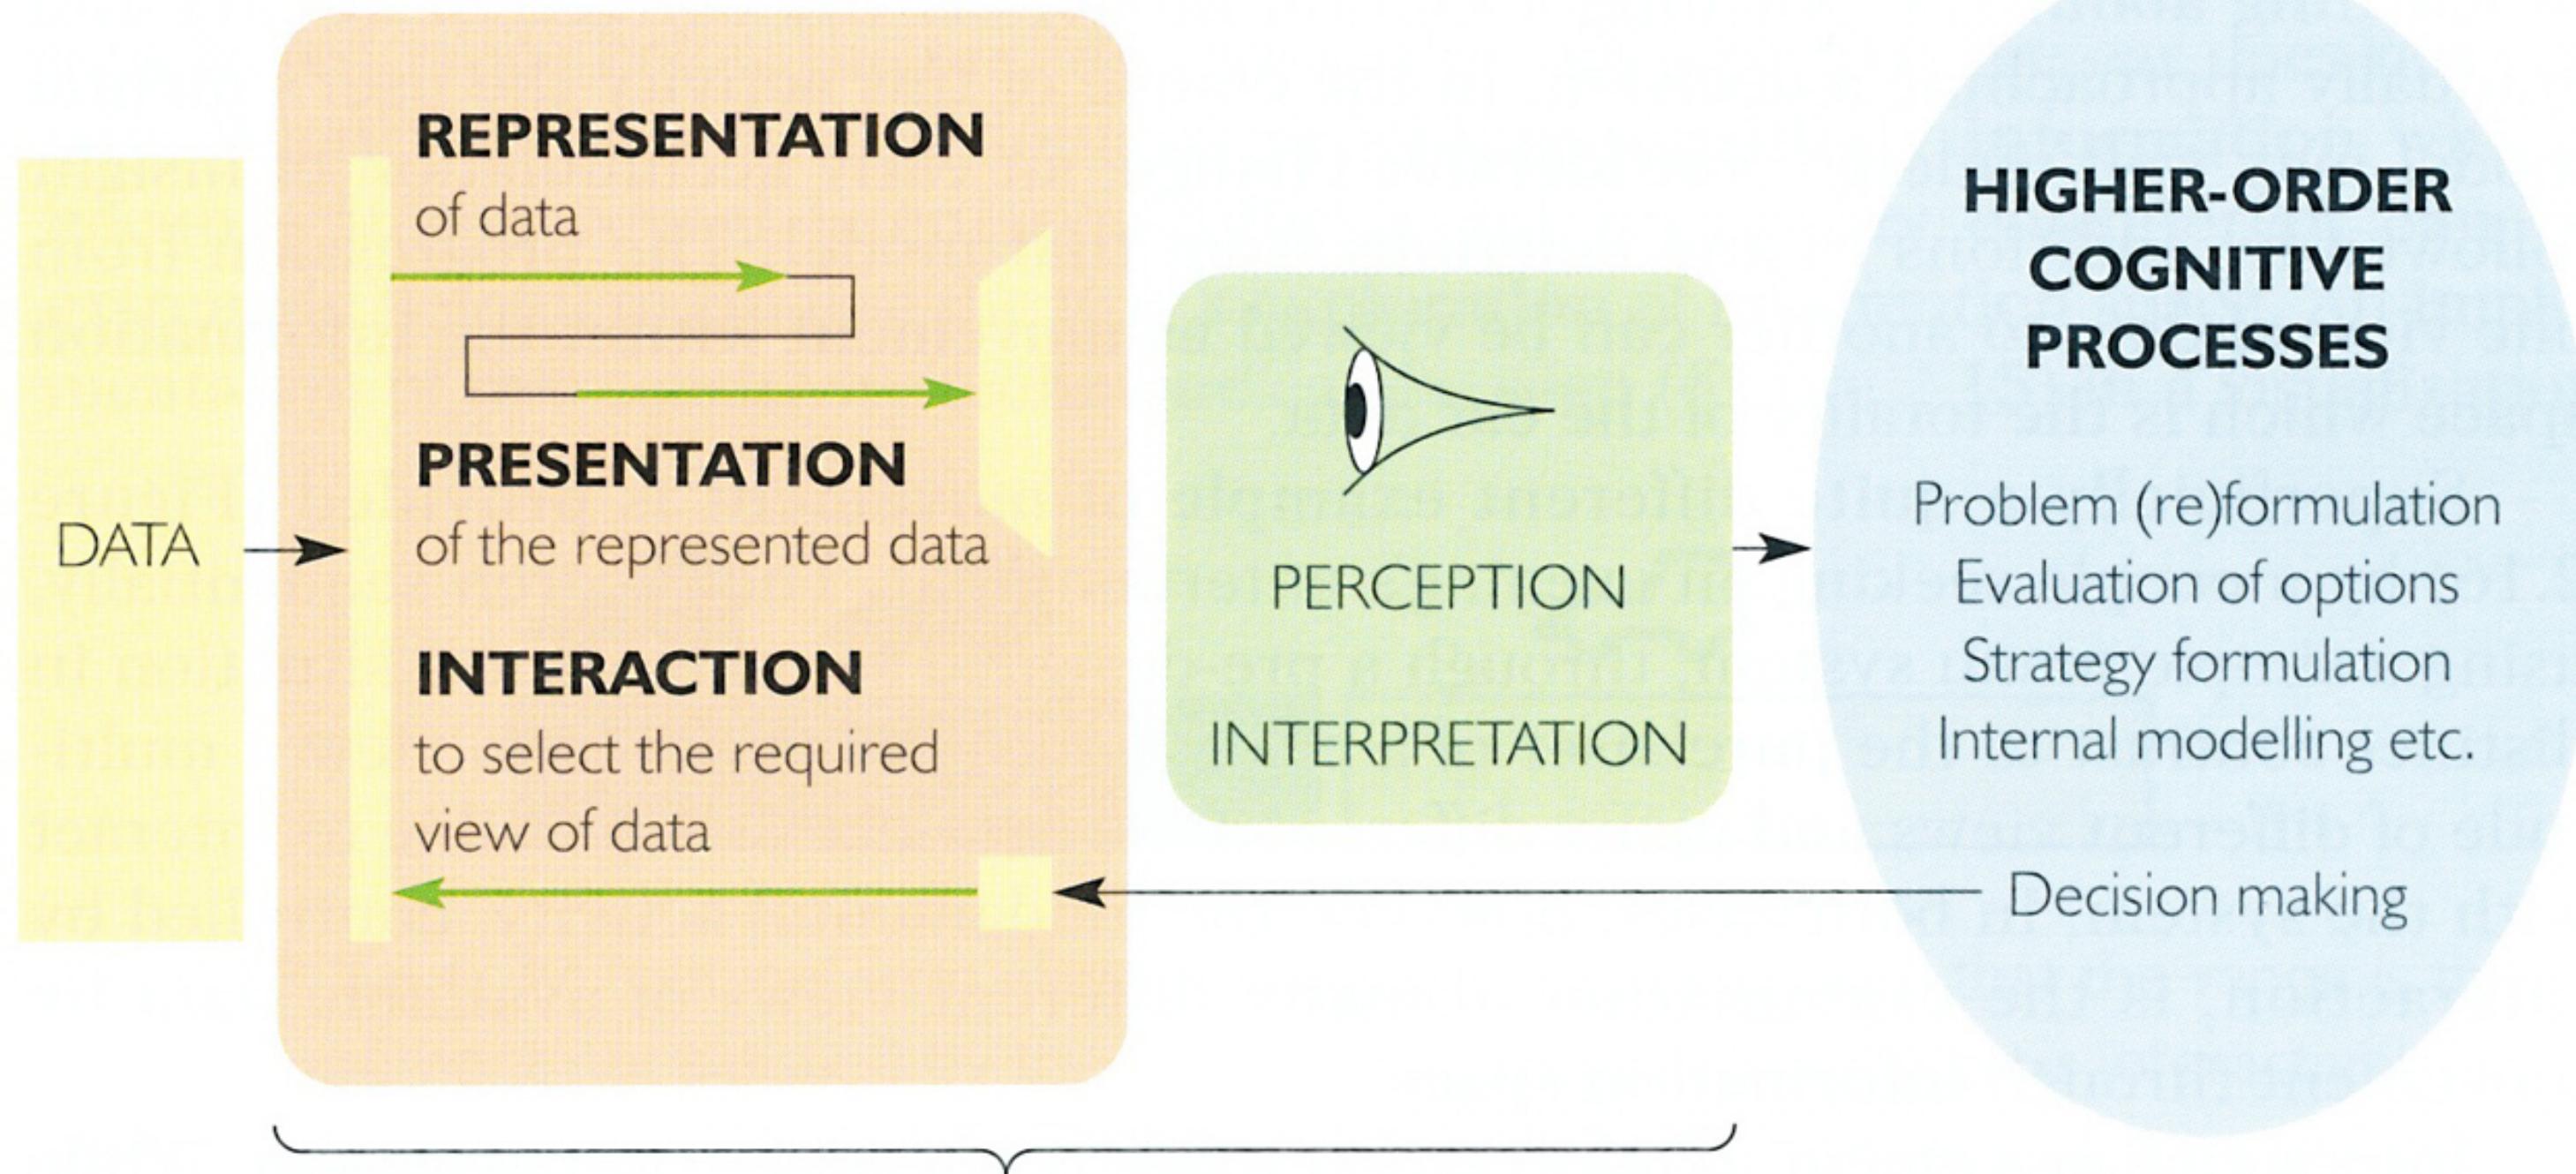

Source: Cairo, Alberto (2019) **How Charts Lie**, W.W. Norton & Company, USA. pg 168.

Graphical Integrity: Show Me the Truth

Do not miss-out what had happened in between.

Human Perception and Information Processing

Pre-attentive Processing

- A limited set of visual properties are processed preattentively (without need for focusing attention).
- This is important for design of visualizations
 - What can be perceived immediately?
 - Which properties are good discriminators?
 - What can mislead viewers?

How Visual Sensing Works?

(i) Fact 1:

We see what we know and expect.

How Visual Sensing Works?

Fact 2:

We do not attend to everything we see.

How Visual Sensing Works?

(i) Fact 3:

We don't remember everything we see.

How Visual Sensing Works?

(i) Fact 3:

We don't remember everything we see.

How Visual Sensing Works?

How Many 3's?

Components of a graph

Bertin's Semiology of graphics

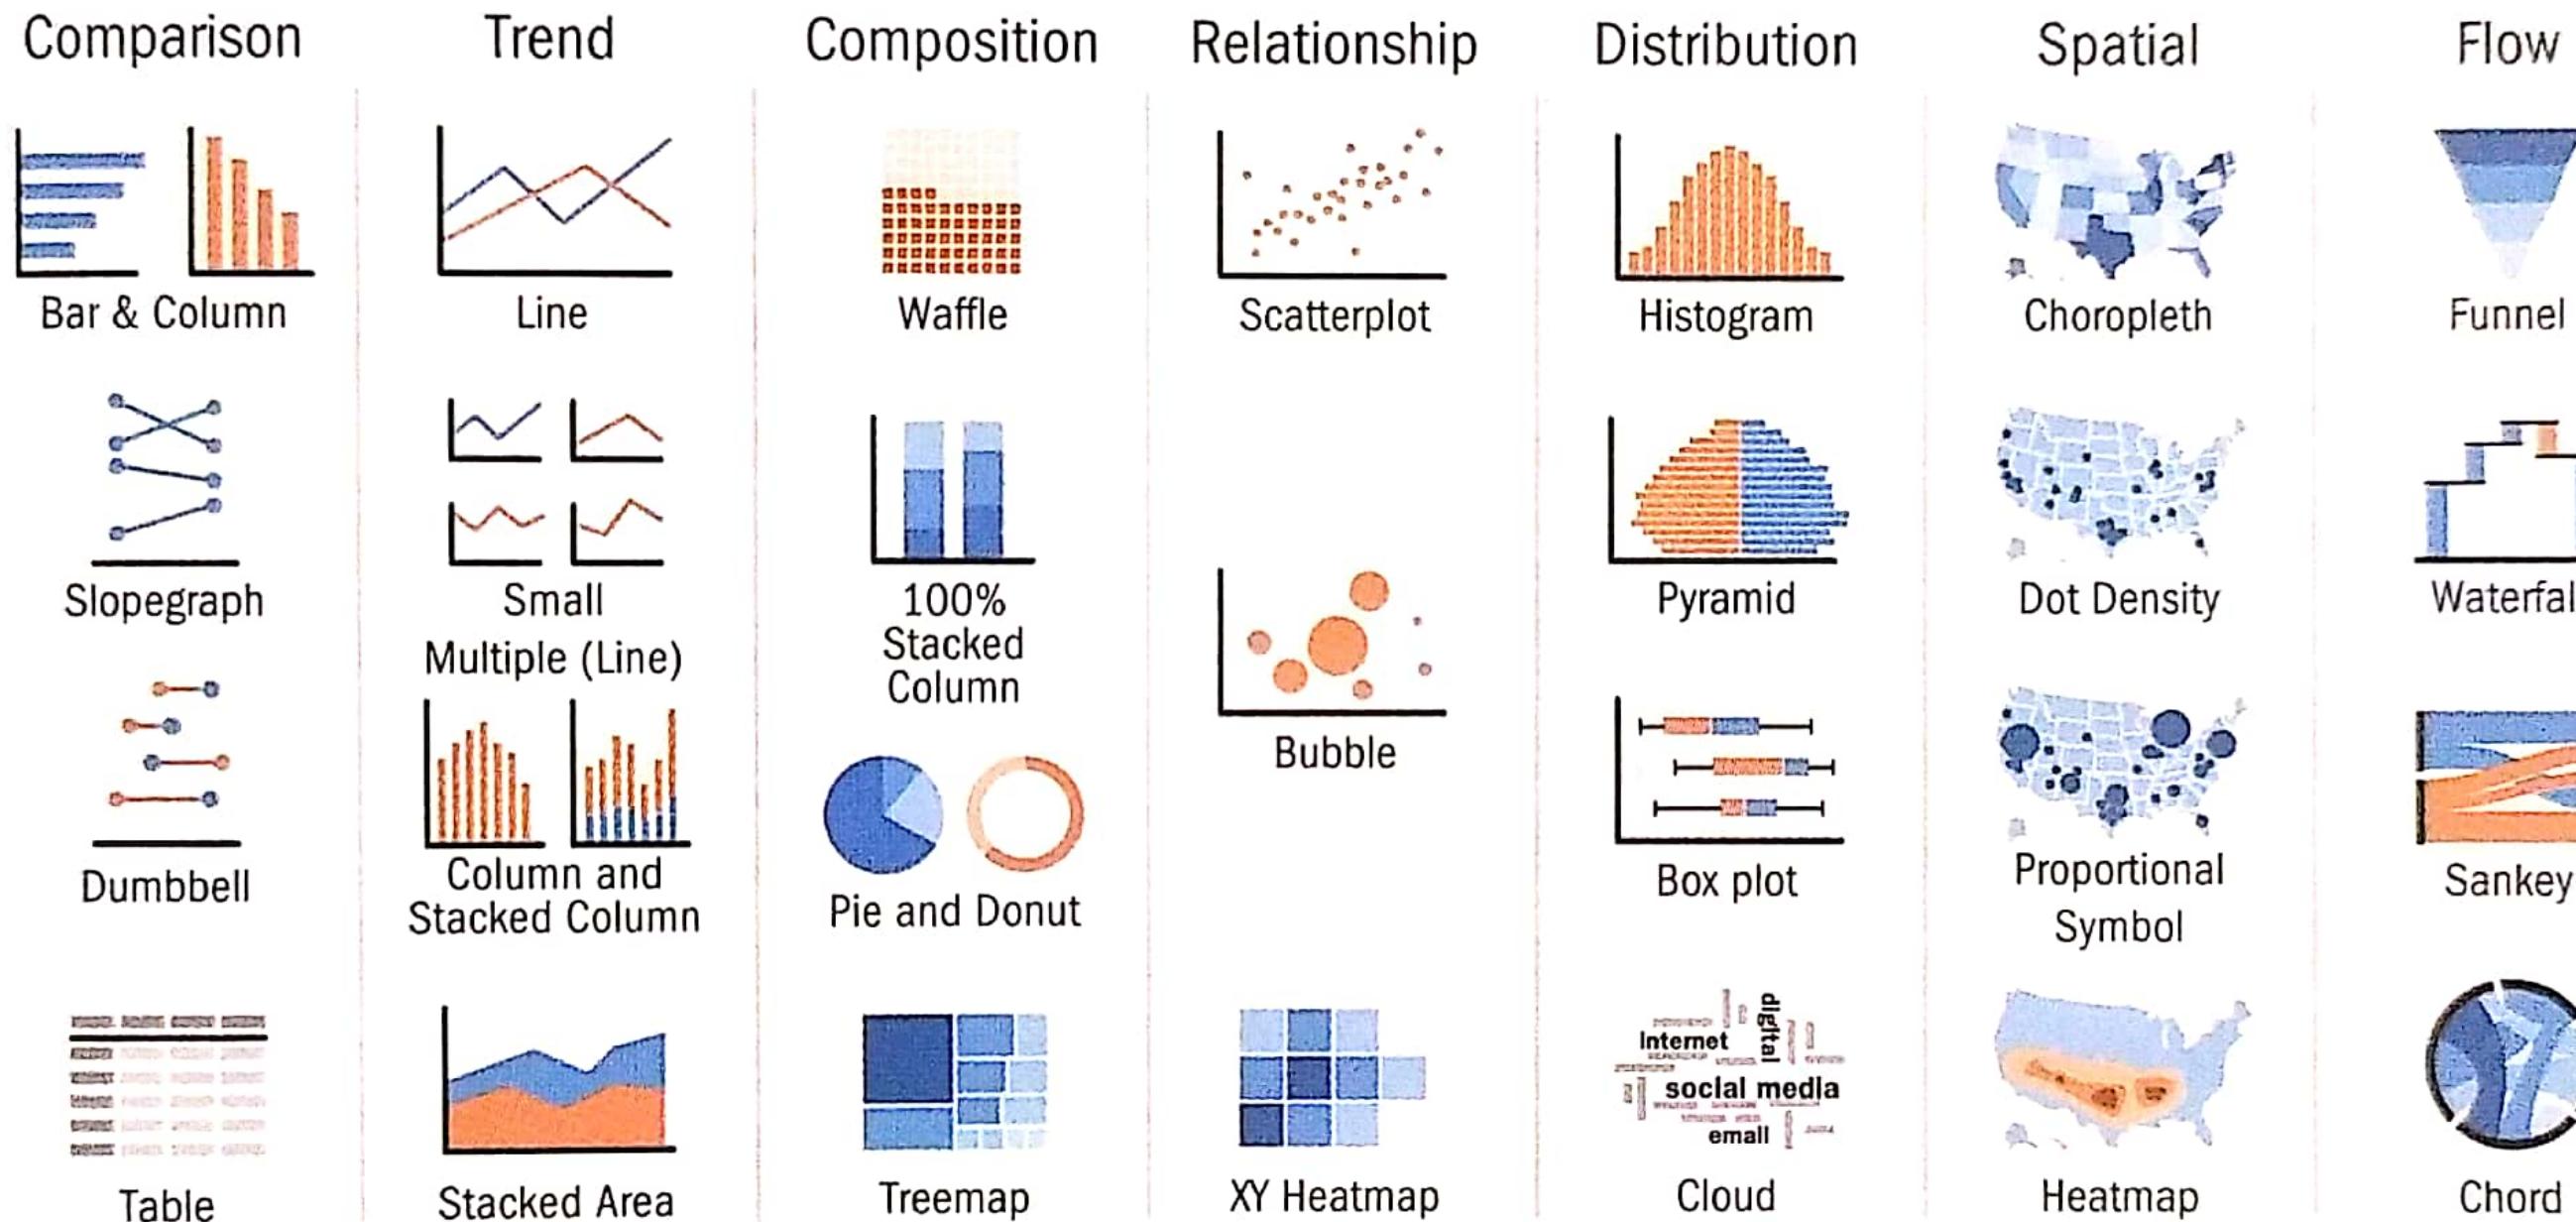

Bertin's Original Visual Variables	
Position changes in the x, y location	
Size change in length, area or repetition	
Shape infinite number of shapes	
Value changes from light to dark	
Colour changes in hue at a given value	
Orientation changes in alignment	
Texture variation in 'grain'

- Data-ink

General Guide: Show the Data Clearly

Guides for Encoding Values in Graph

Guide 1:

Avoid using point alone to display time-series data.

Guides for Encoding Values in Graph

(i) Guide 2:

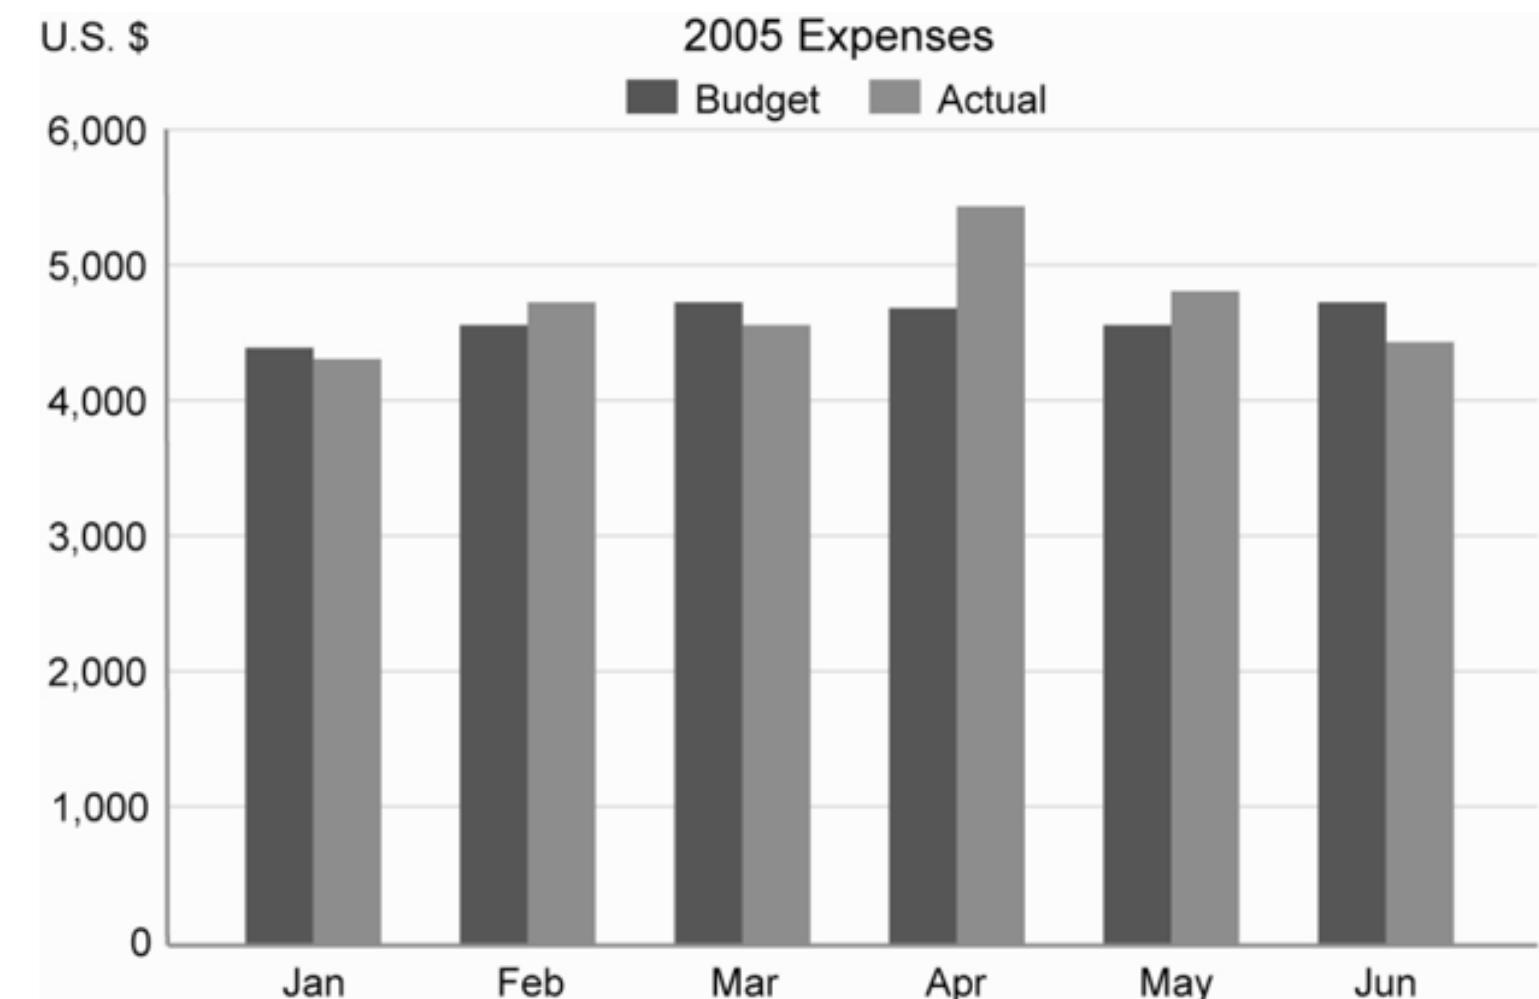

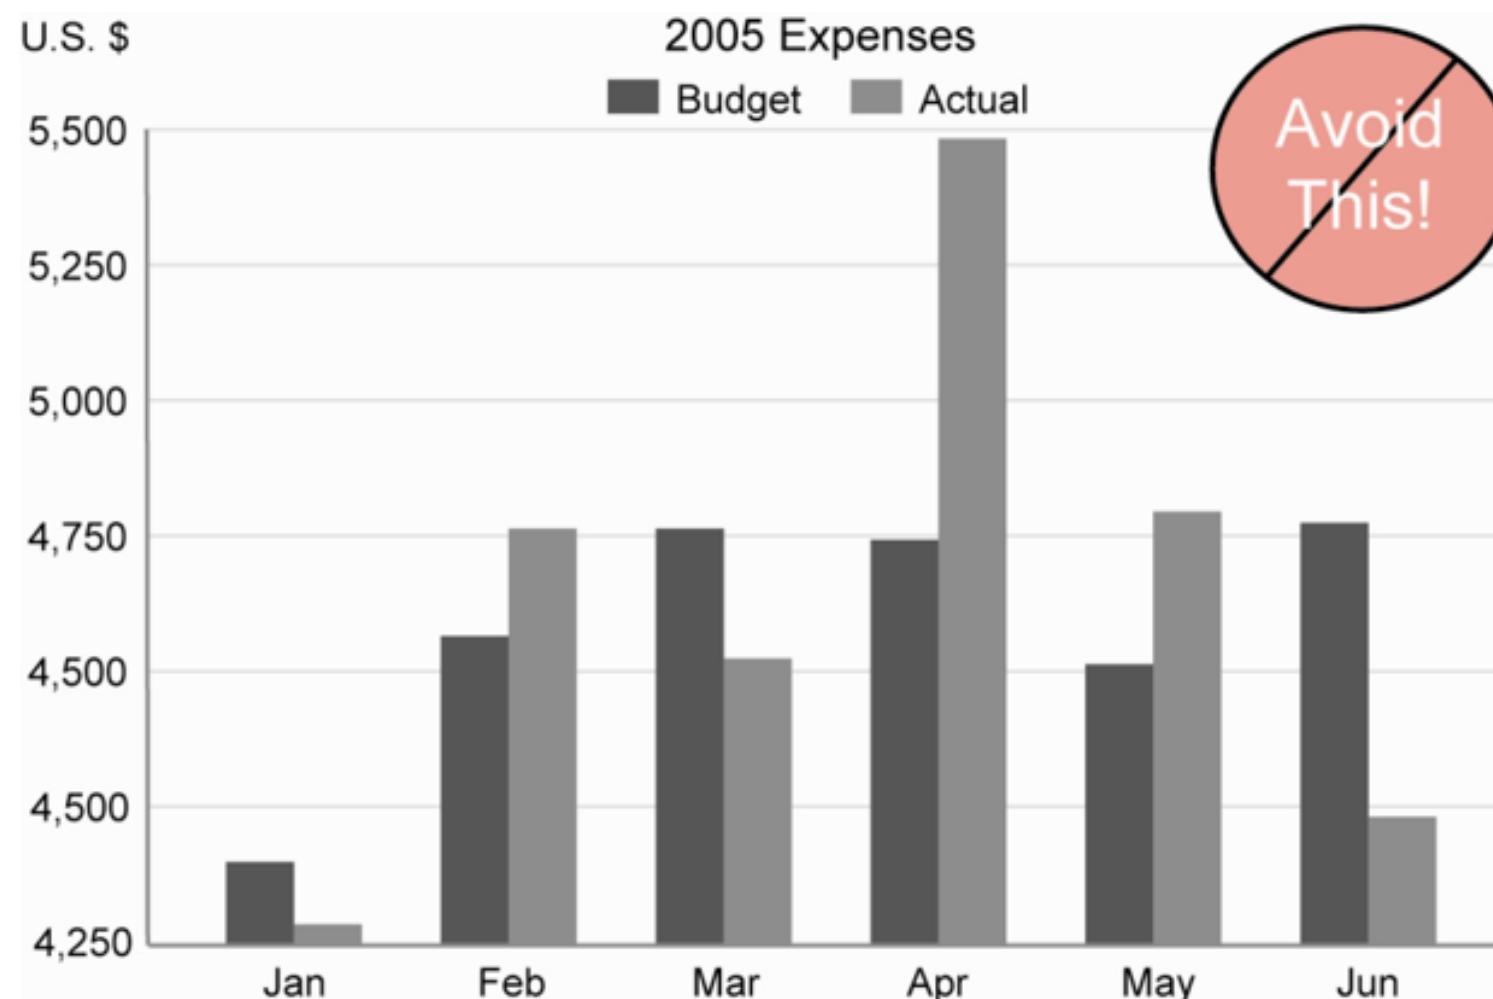

Avoid using points to represent discrete values

Guides for Encoding Values in Graph

(i) Guide 3:

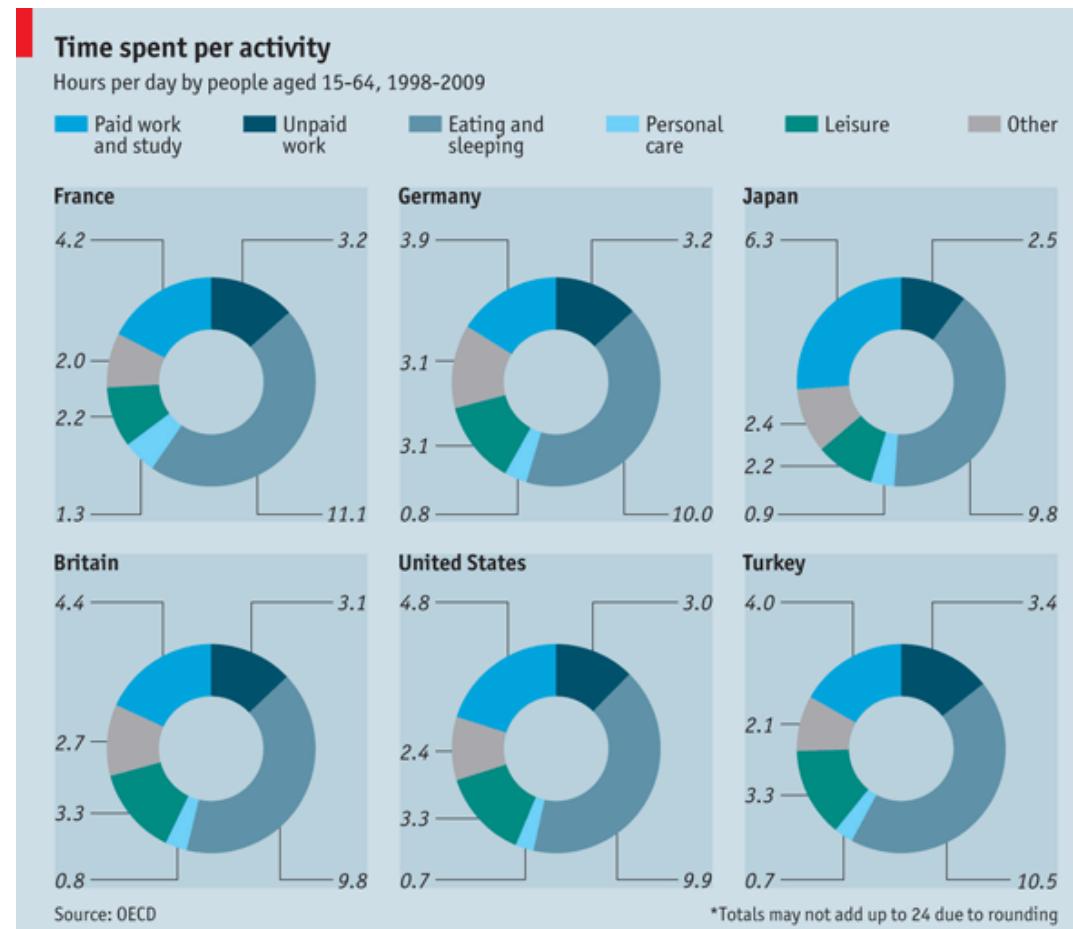

Bars don't work unless the quantitative scale begins at zero

Guide for Encoding Values in Graph

(i) Guide 4:

Avoid pie chart if possible because our eyes are not good in reading areas

Guide for Encoding Values in Graph

(i) Guide 5:

Avoid pie chart if you are comparing changes over time

Avoid This!

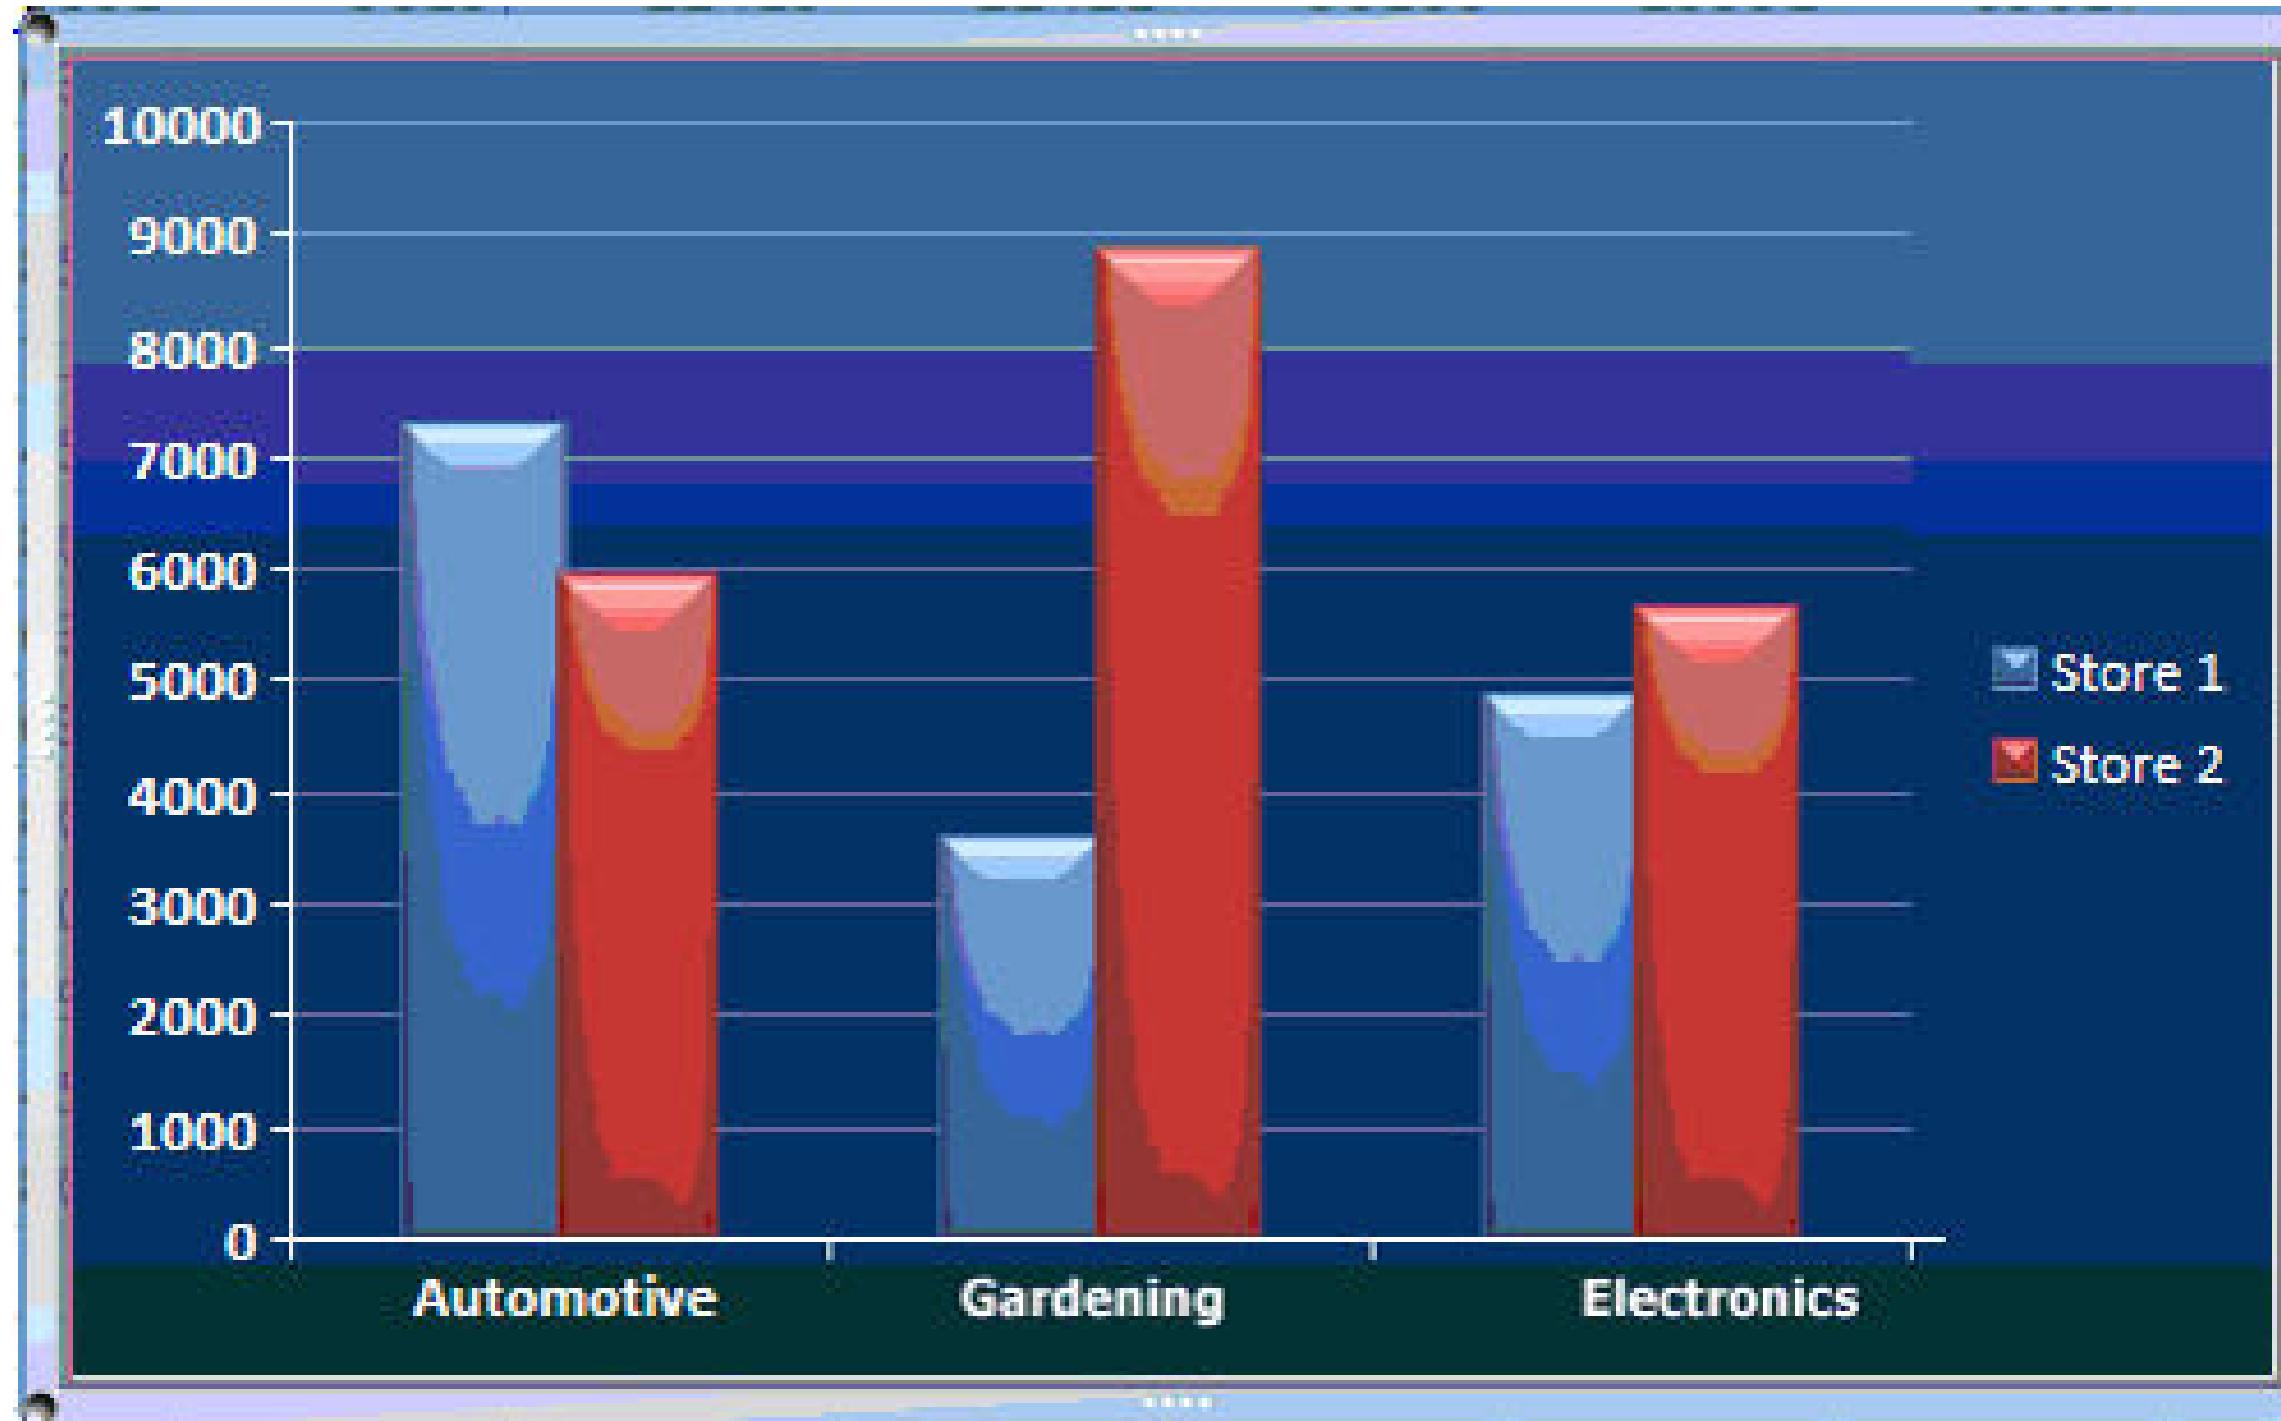

:scale 80%

Design principles for effective visual presentation

- Guides for Encoding Values in Graph
- **Chartjunk**
- Practical Guides for Using Colour in Charts
- Data-ink

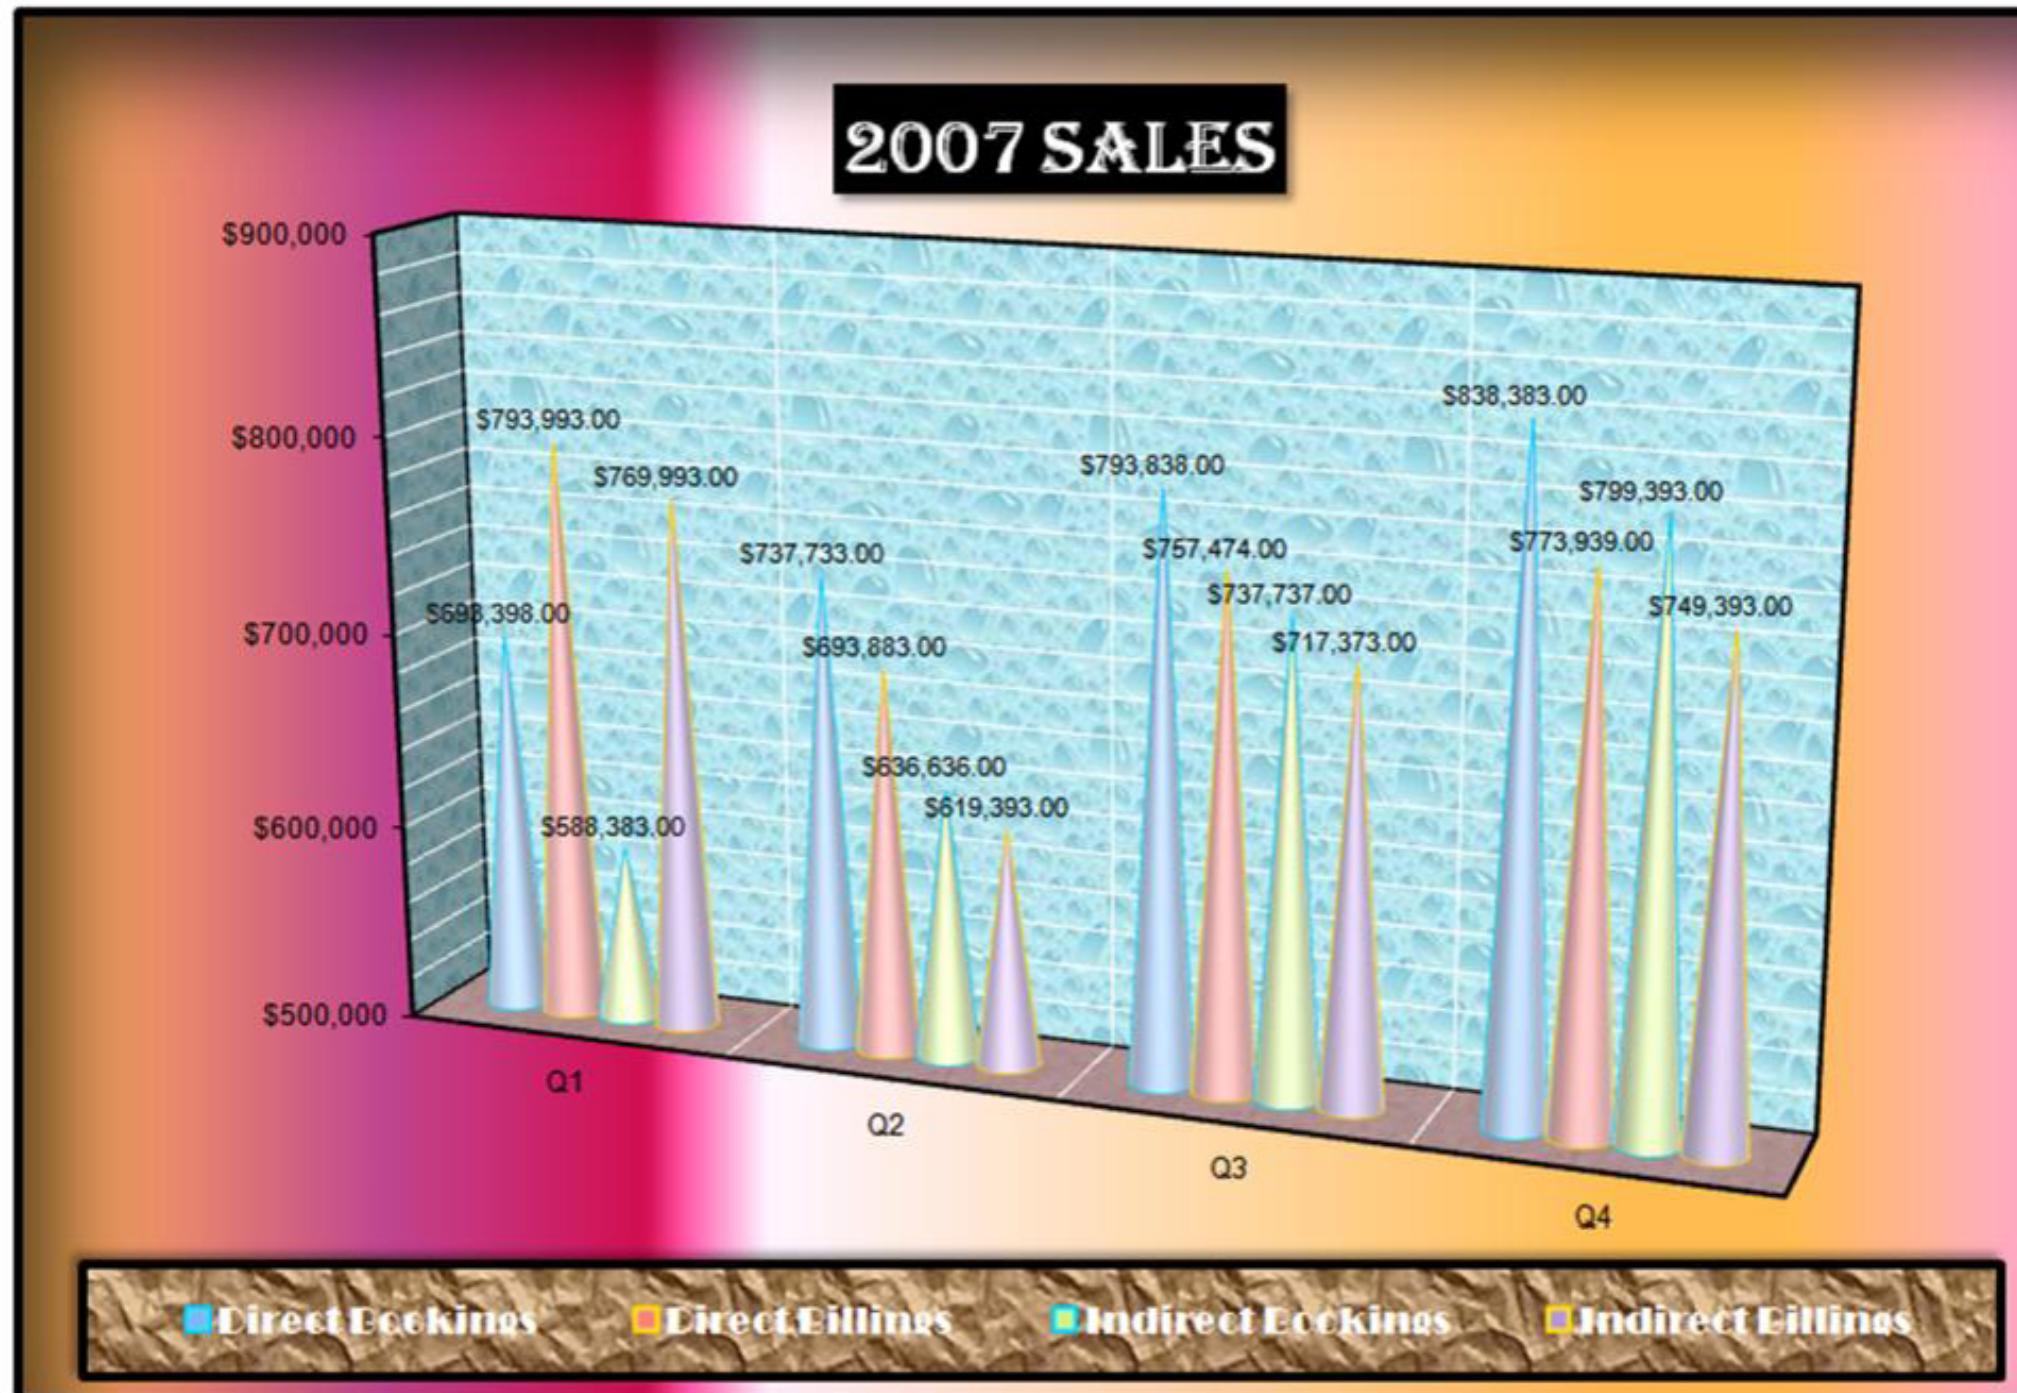

ChartJunk I

Avoid using unnecessary colour shading for the bar.

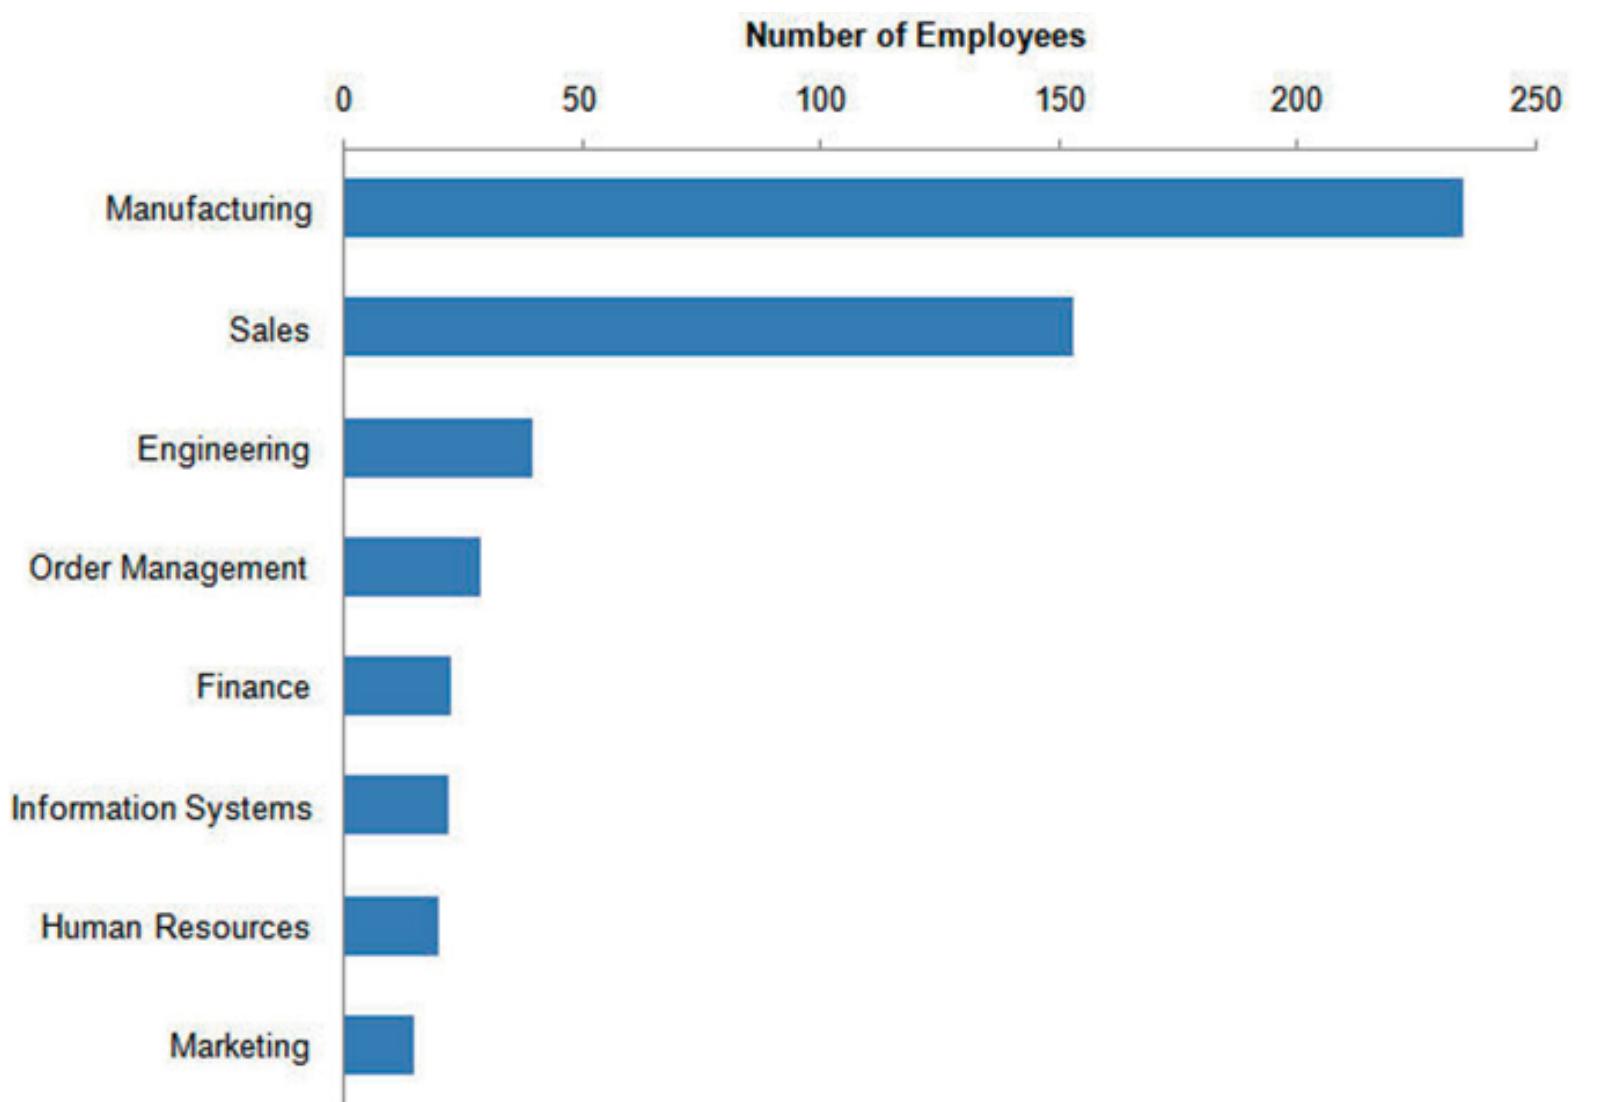

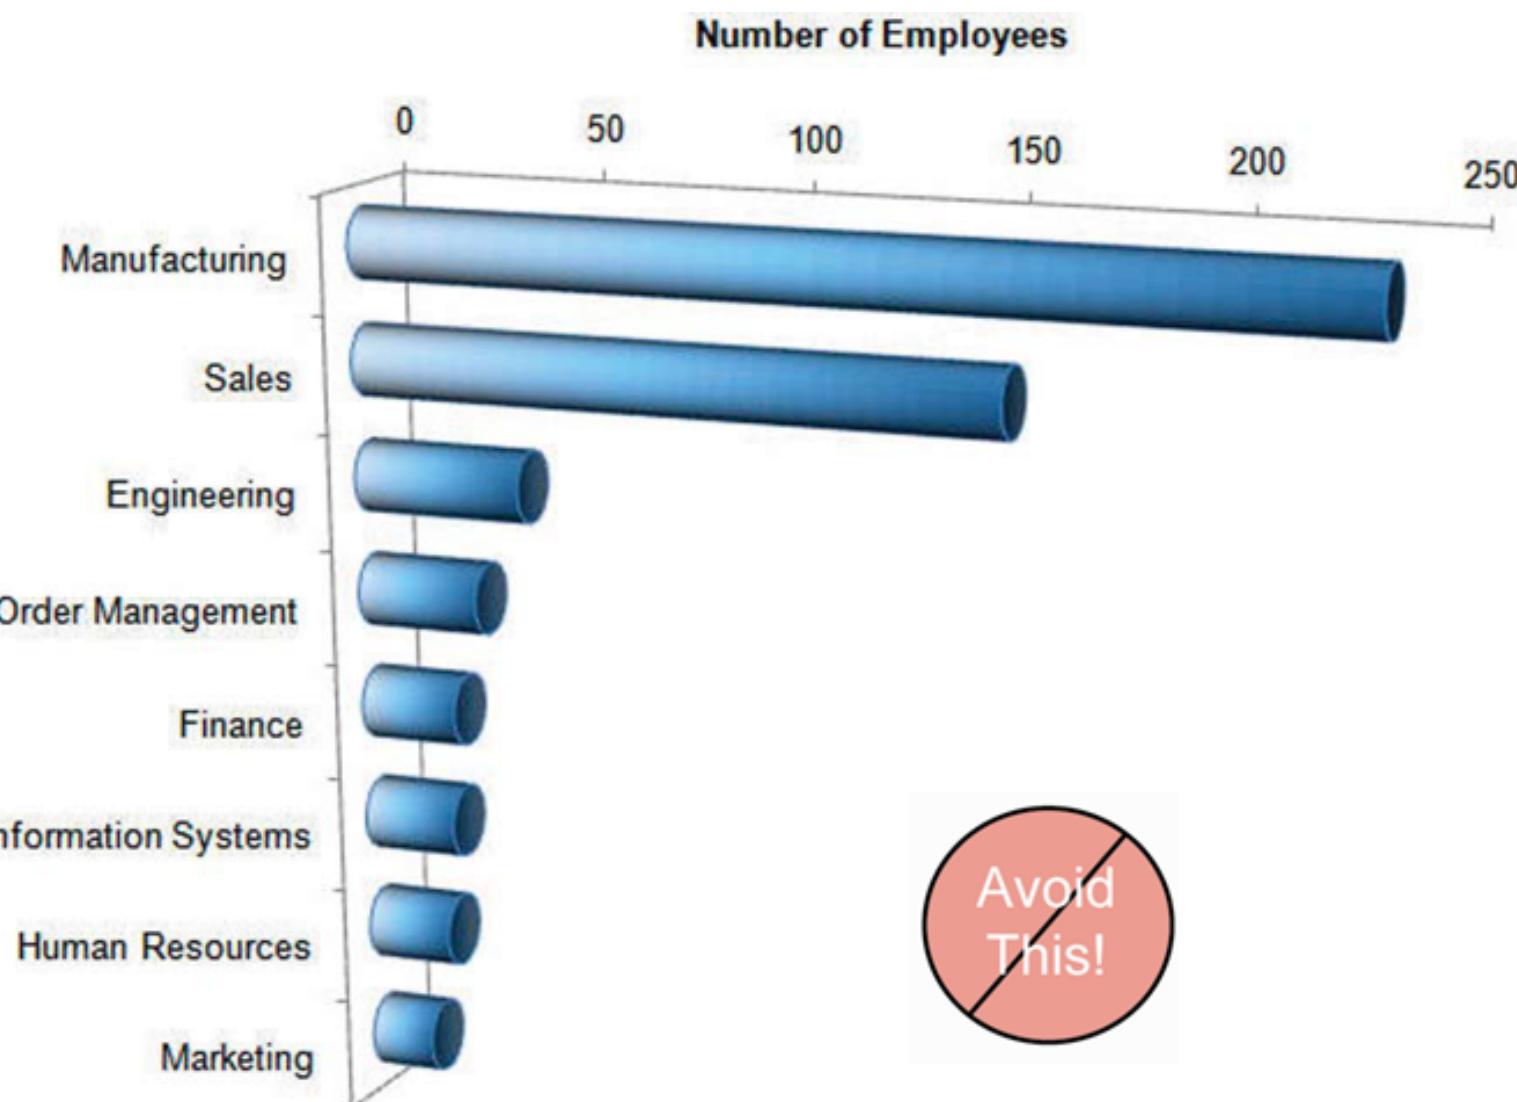

ChartJunk II

Avoid colourful or wallpaper background.

ChartJunk III

Avoid using 3D effects in graphics.

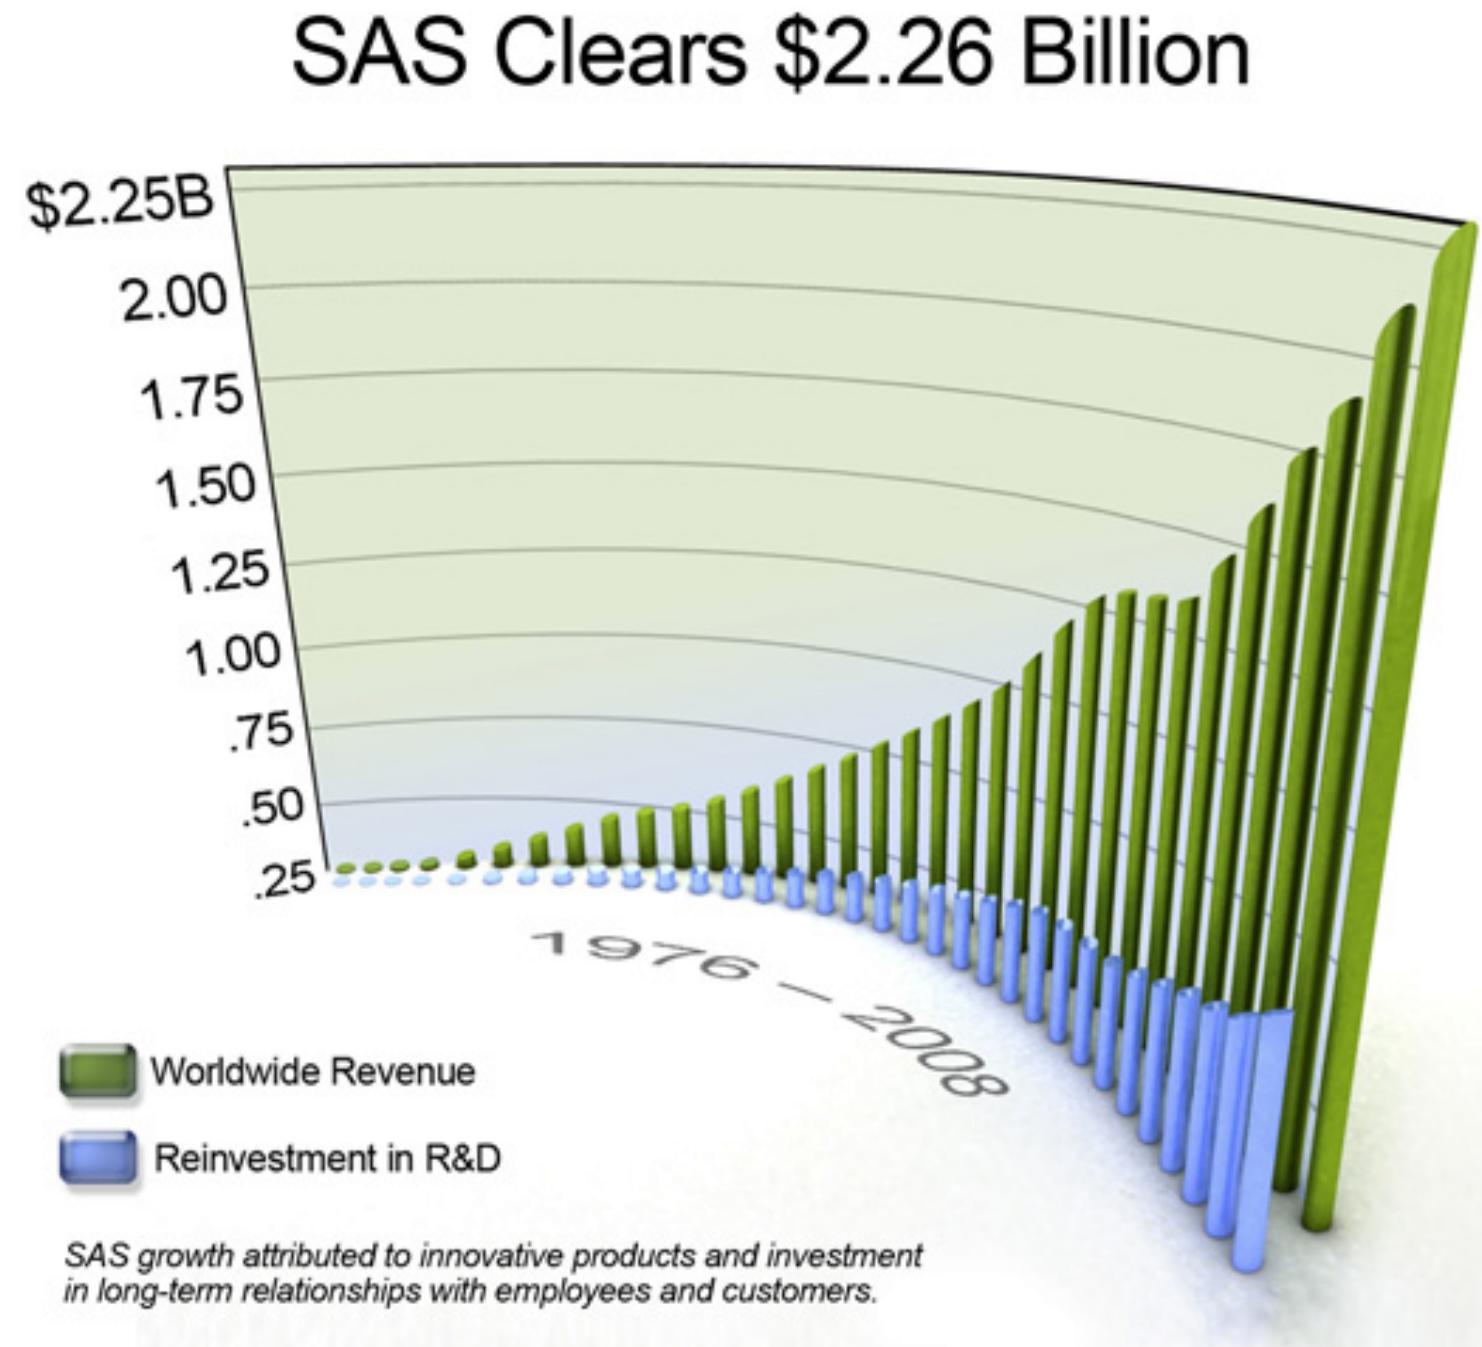

ChartJunk IV

Avoid using misleading graphical representation.

ChartJunk V

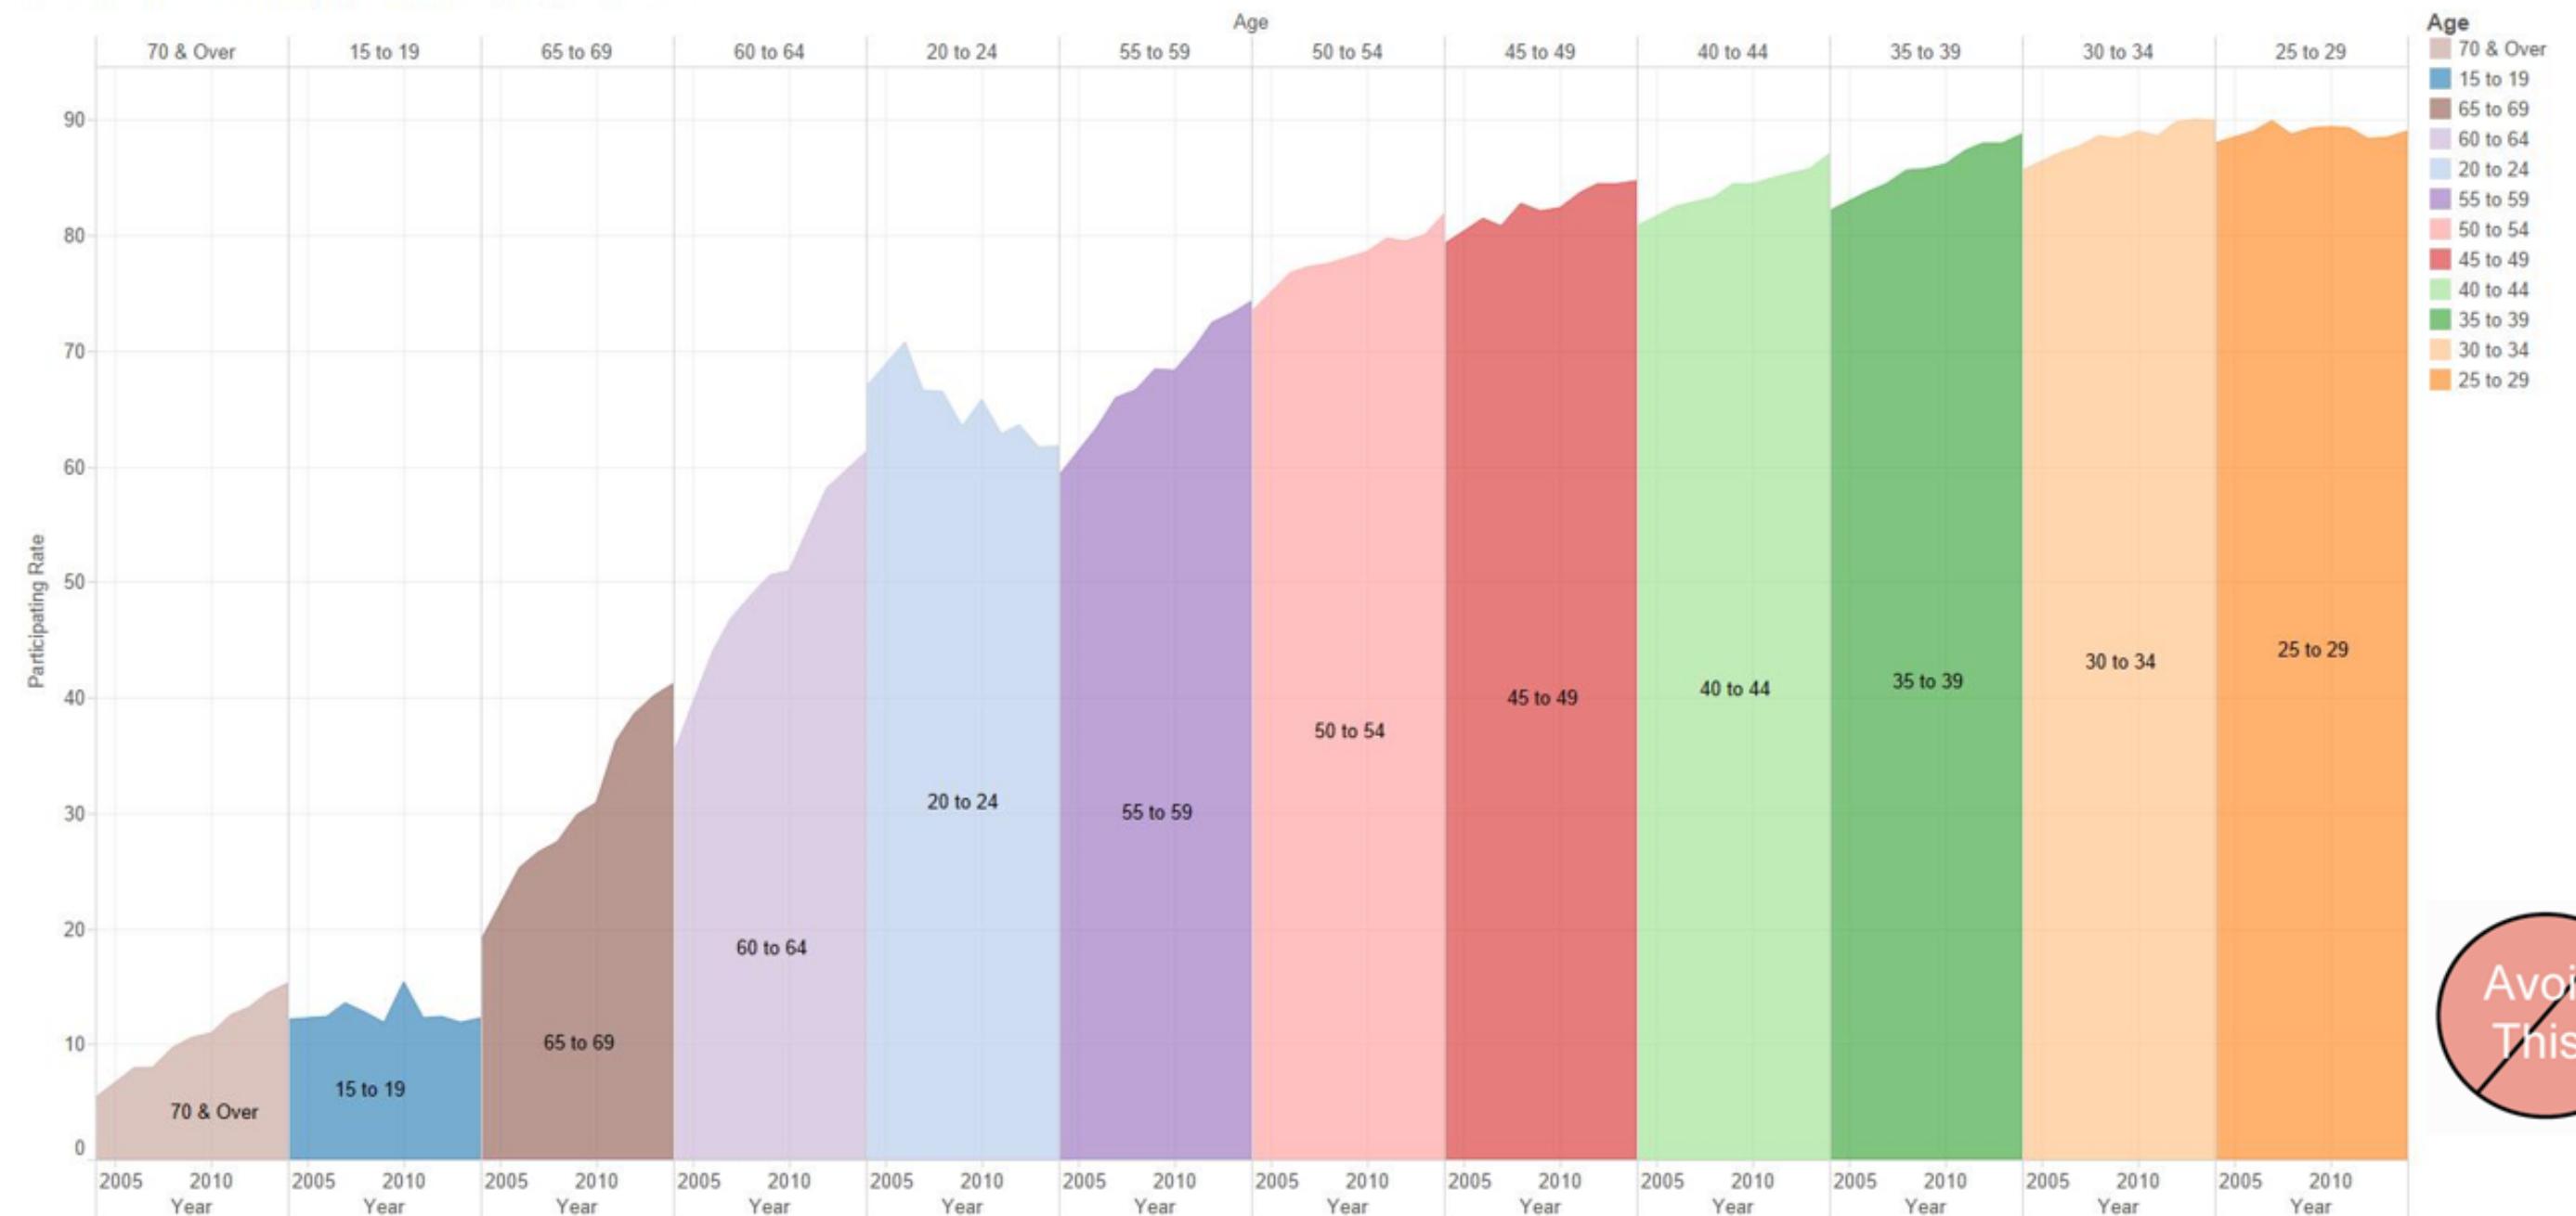

Avoid using artistic design which is difficult to visualise.

ChartJunk VI

Designing graph to enlighten people – not to entertain them.

Labour Force Participation Rate by Age and Year

The plot of sum of Participating Rate for Year broken down by Age. Color shows details about Age. The marks are labeled by Age. The view is filtered on sum of Participating Rate, Age and Year. The sum of Participating Rate filter keeps non-Null values only. The Age filter excludes Total. The Year filter ranges from 2004 to 2014.

Design principles for effective visual presentation

- JunkCharts
- Practical Guides for Using Colour in Charts
- Data-ink

Practical Guides for Using Colour in Charts

Guide 1:

If you want different objects of the same colour in a graph to look the same, make sure that the background- the colour that surrounds them – is consistent.

Practical Guides for Using Colour in Charts

(i) Guide 2:

If you want objects in a graph to be easily seen, use a background colour that contrasts sufficiently with the object.

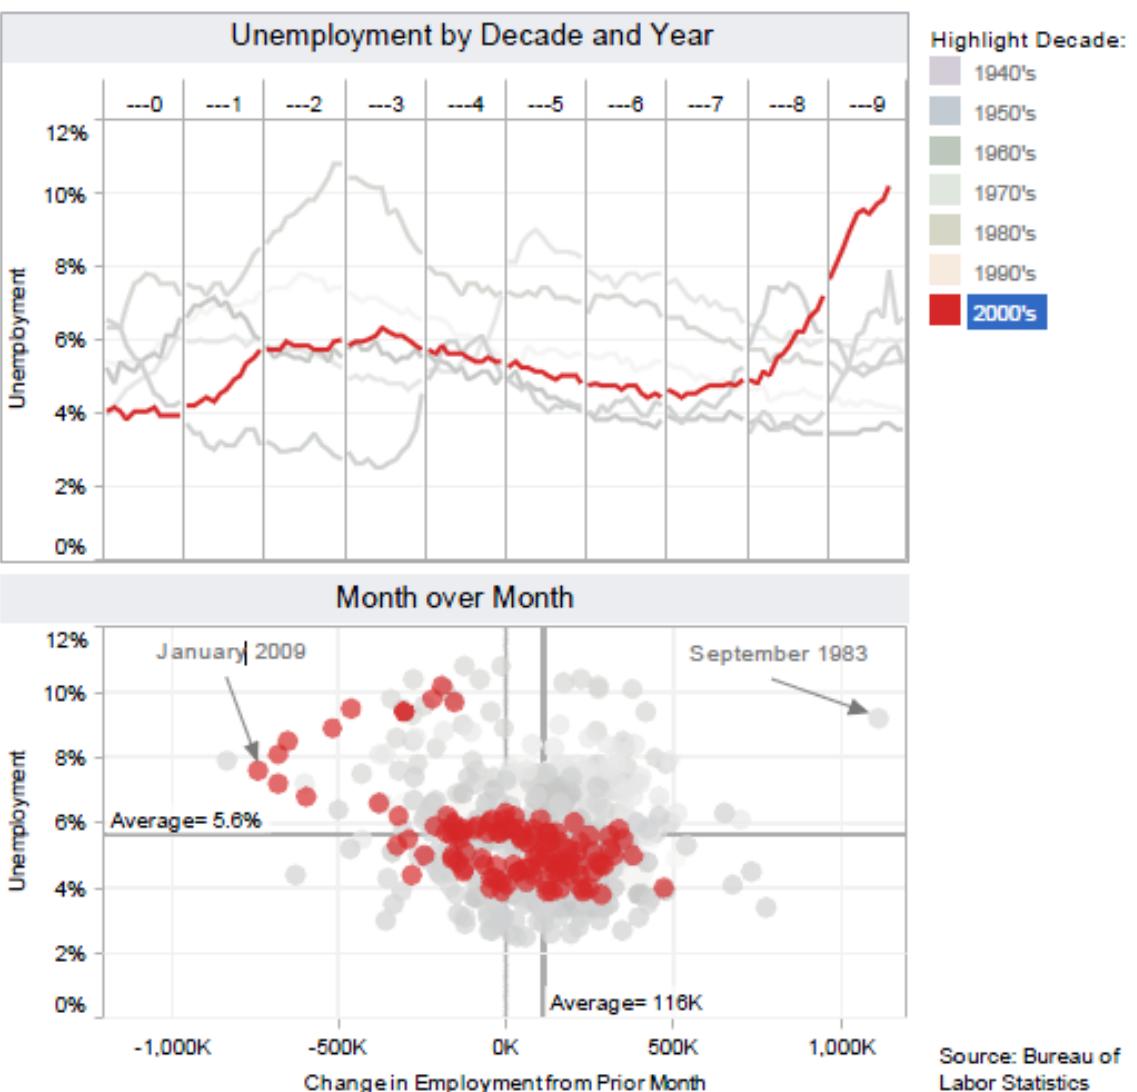

name	age	sex	height	weight	mean weight by age
KATIE	12	F	59	95	99.000
LOUISE	12	F	61	123	99.000

WILLIAM	15	M	65	111	108.286

Practical Guides for Using Colour in Charts

(i) Guide 3:

Use color only when needed to serve a particular communication goal.

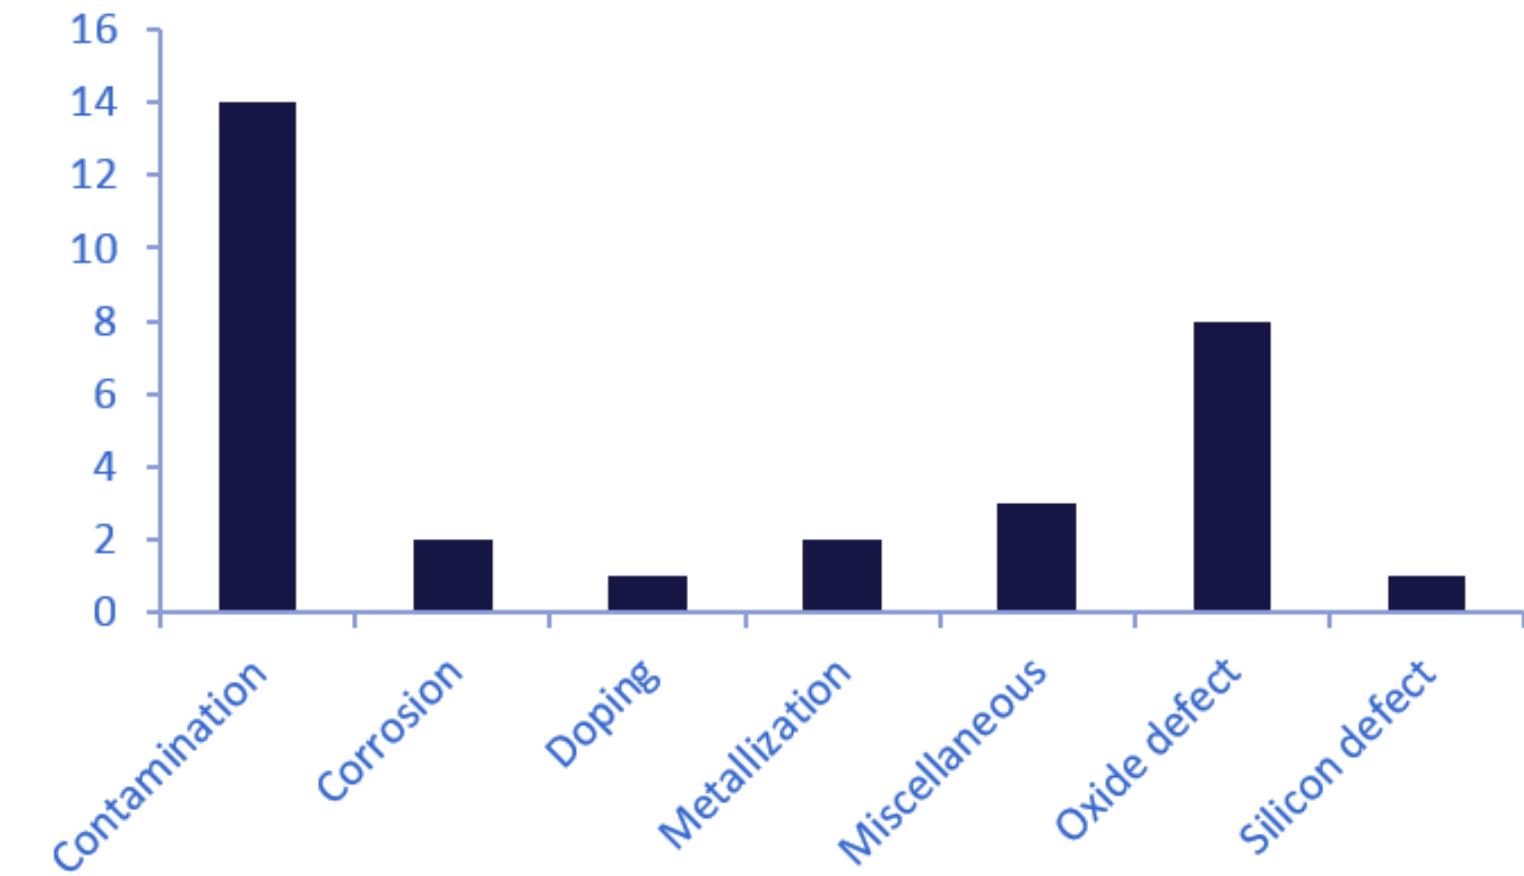

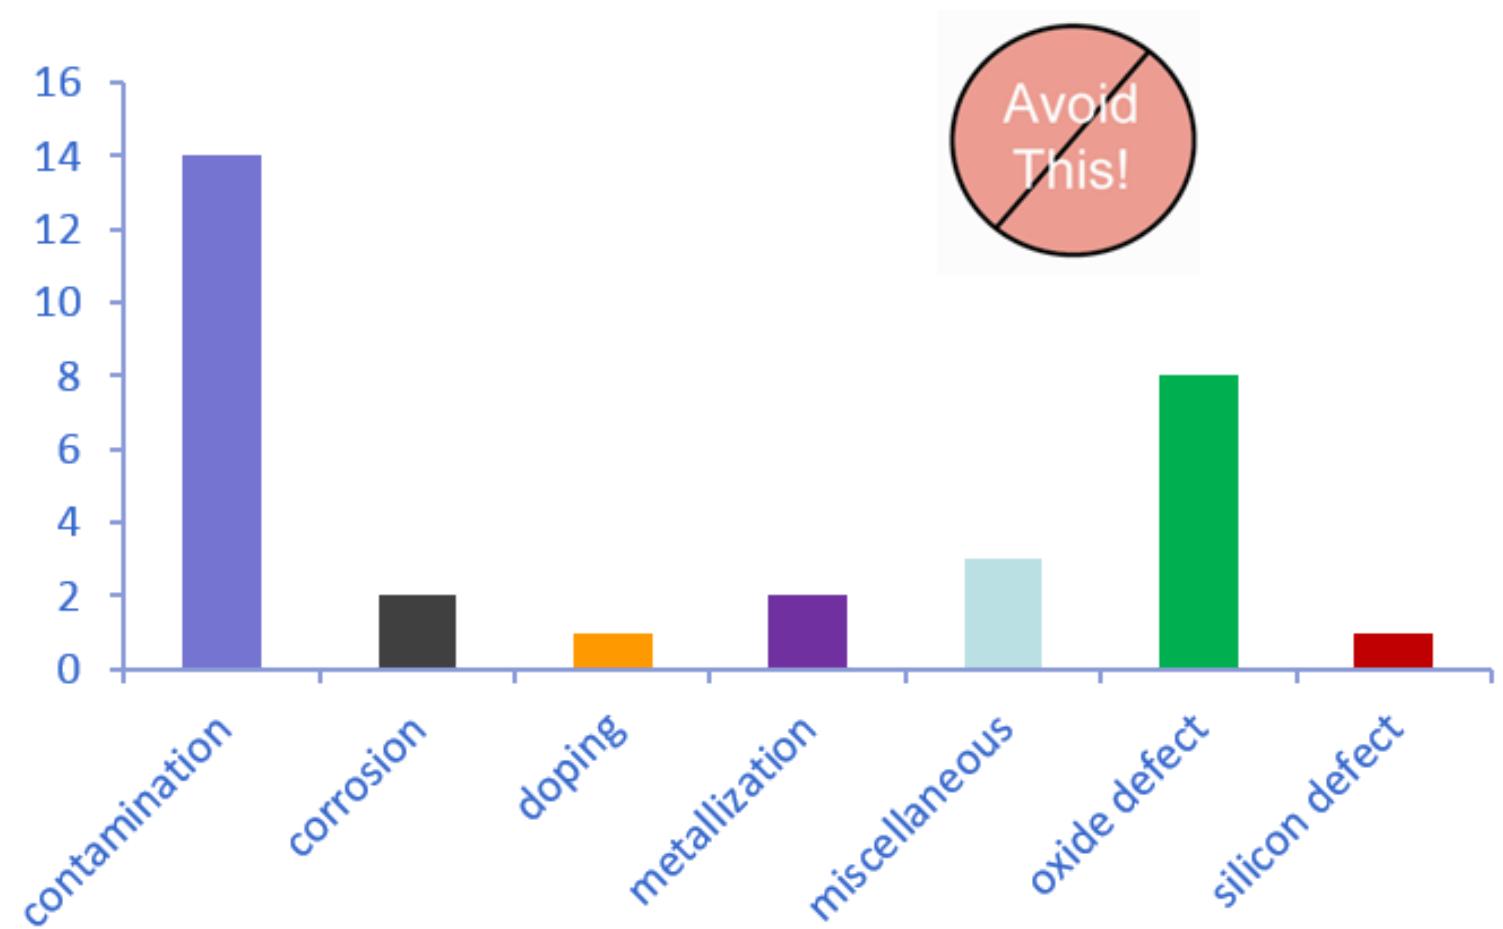

60 Years of Unemployment

Practical Guides for Using Colour in Charts

(i) Guide 4:

Use different colours when they correspond to differences of meaning in the data.

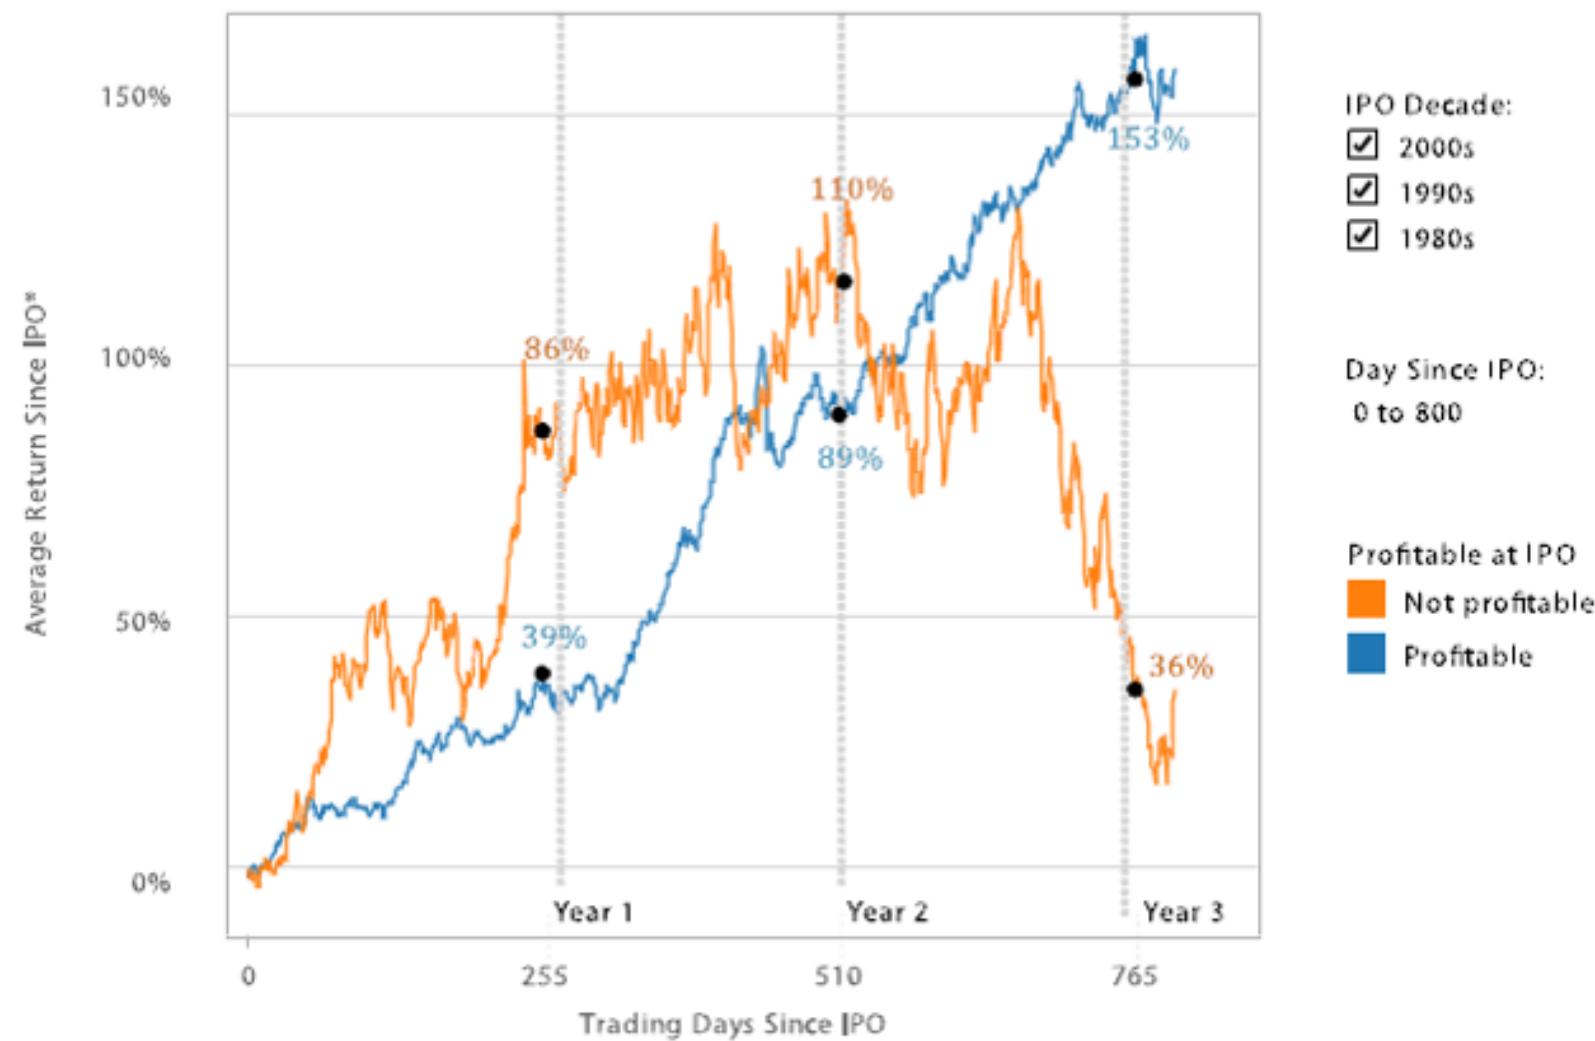

Practical Guides for Using Colour in Charts

(i) Guide 5:

Use soft, natural colours to display most information and bright and/or dark colours to highlight information that requires greater attention.

Profitable vs. Unprofitable IPOs

Practical Guides for Using Colour in Charts

① Guide 6:

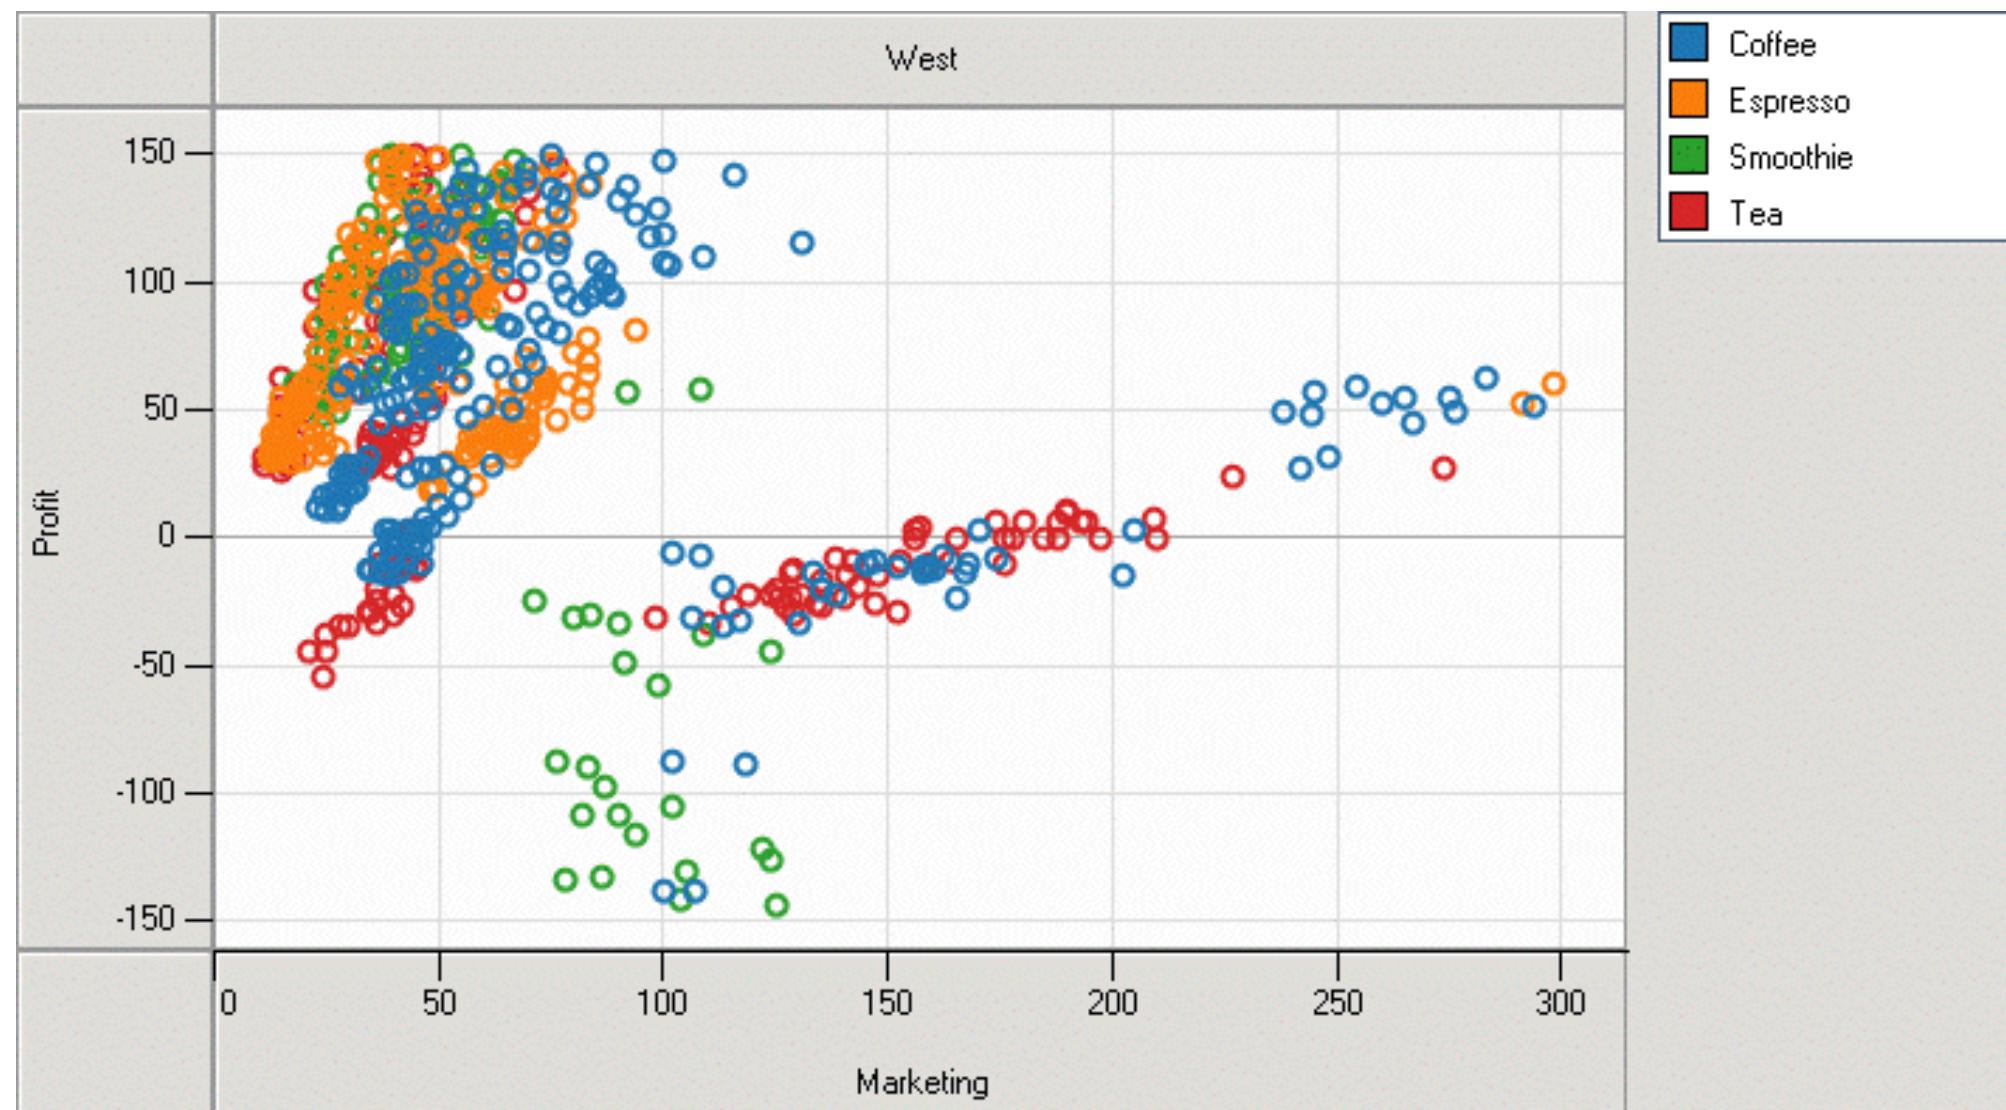

When using colour to encode a sequential range of quantitative values, stick with a single hue (or a small set of closely related hues) and vary intensity from pale colours for low values to increasingly darker and brighter colours for high values.

Practical Guides for Using Colour in Charts

(i) Guide 7:

Non-data components of a graph should be displayed just visibly enough to perform their role, but not more so, for excessive salience could cause them to distract attention from the data.

Practical Guides for Using Colour in Charts

Guide 8:

To guarantee that most people who are colourblind can distinguish groups of data that are colour coded, avoid using a combination of red and green in the same display.

non color blind

protanope
(red cone cells defective)

deuteranope
(green cone cells defective)

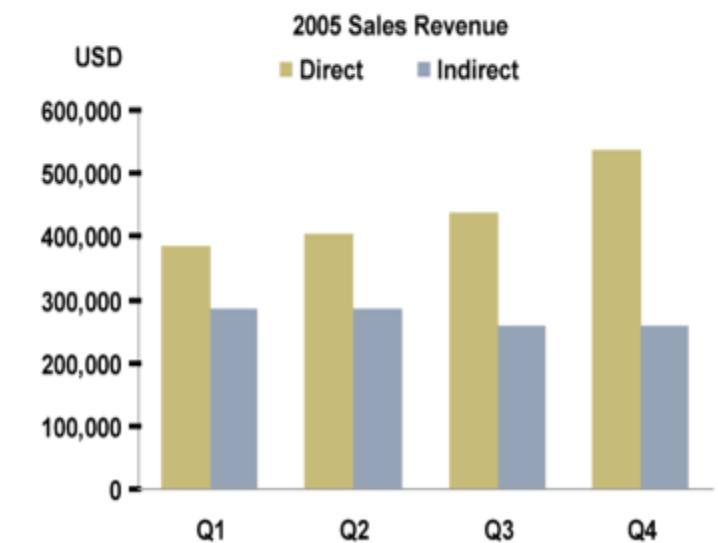

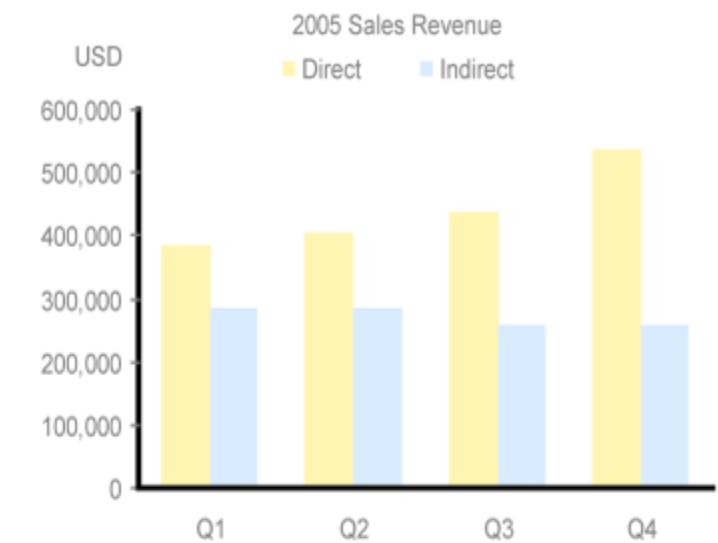

tritanope
(blue cone cells defective)

Design principles for effective visual presentation

- Guides for Encoding Values in Graph
- JunkCharts
- Practical Guides for Using Colour in Charts
- Data-ink

Data-ink

- Reduce the non data-ink
 - Removed unnecessary non data-ink
 - De-emphasise or regularise the remaining non data-ink
- Enhance the data-ink
 - Remove unnecessary data-ink
 - Emphasise the remaining data-ink

Practical used of data-ink

Shouting to emphasize what's interesting

(Dark data points ● represent last year's top 10 customers based on the number of orders placed.
The largest data point represents last year's top customer.)

What should the relative lengths of the axis be?

- Should not manipulate the aspect ratio to intentionally exaggerate or downplay the rate of change.
- Stick to the convention of making your graphs wider than being tall.

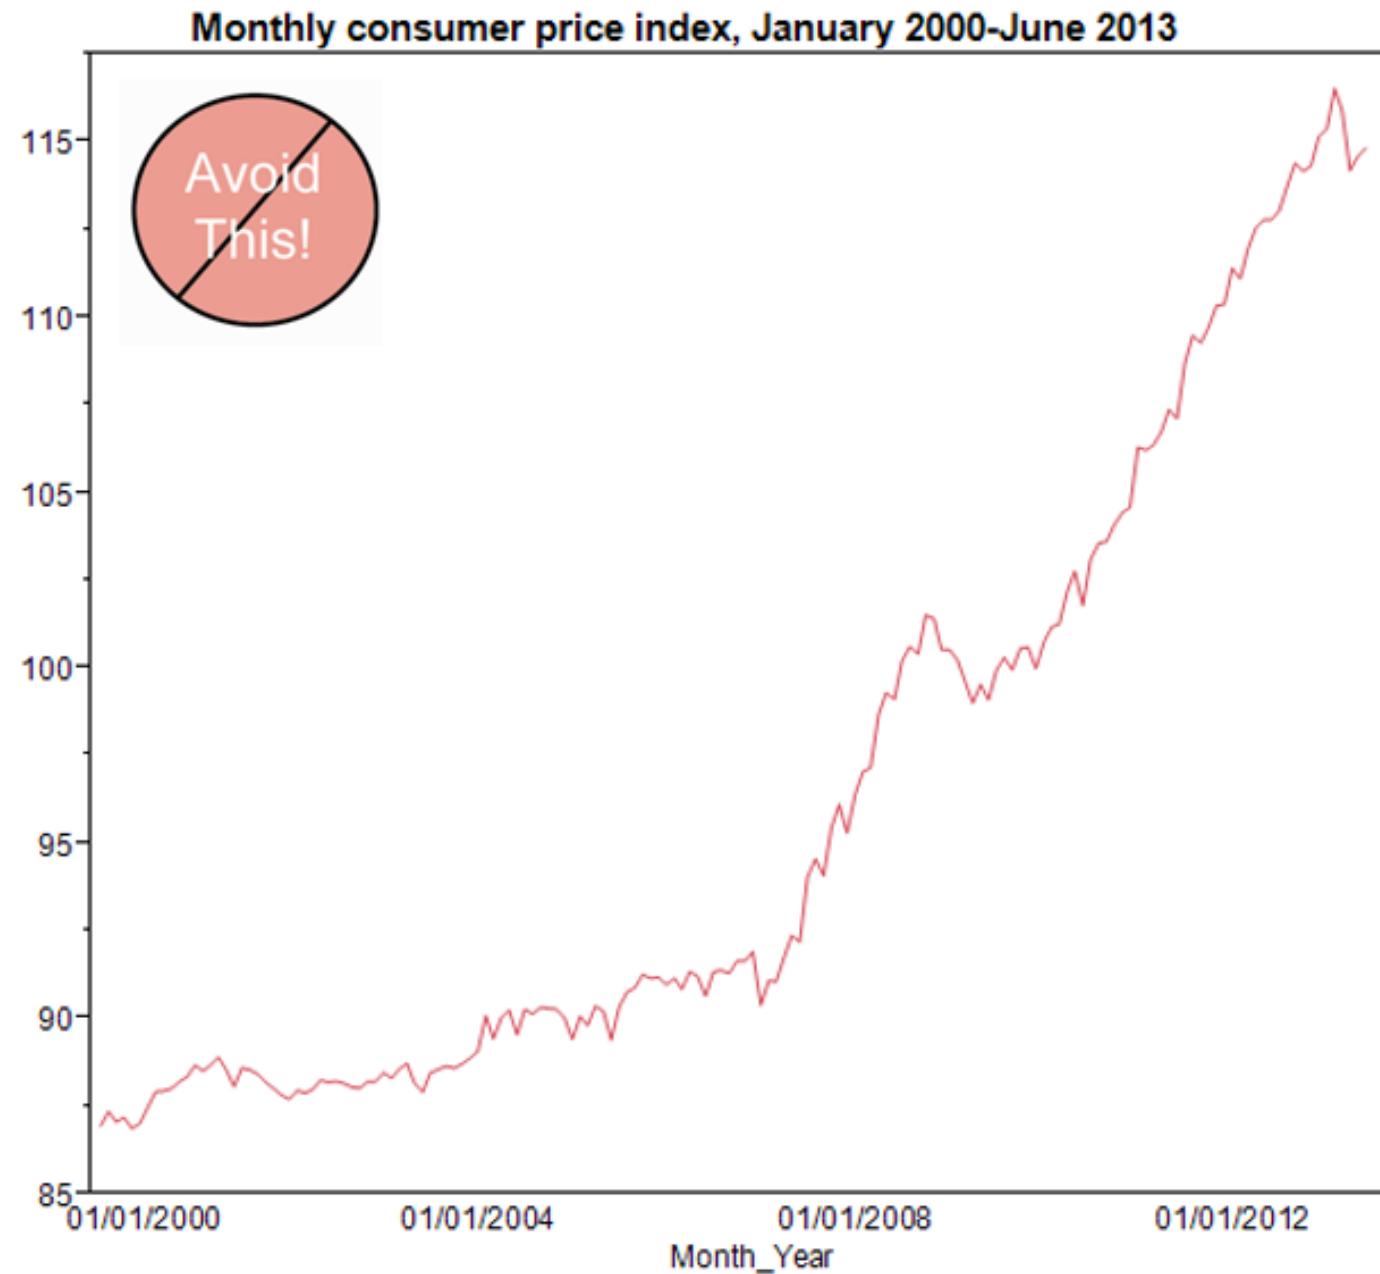

When can you eliminate tick mark?

Tick marks are superfluous on categorical scale.

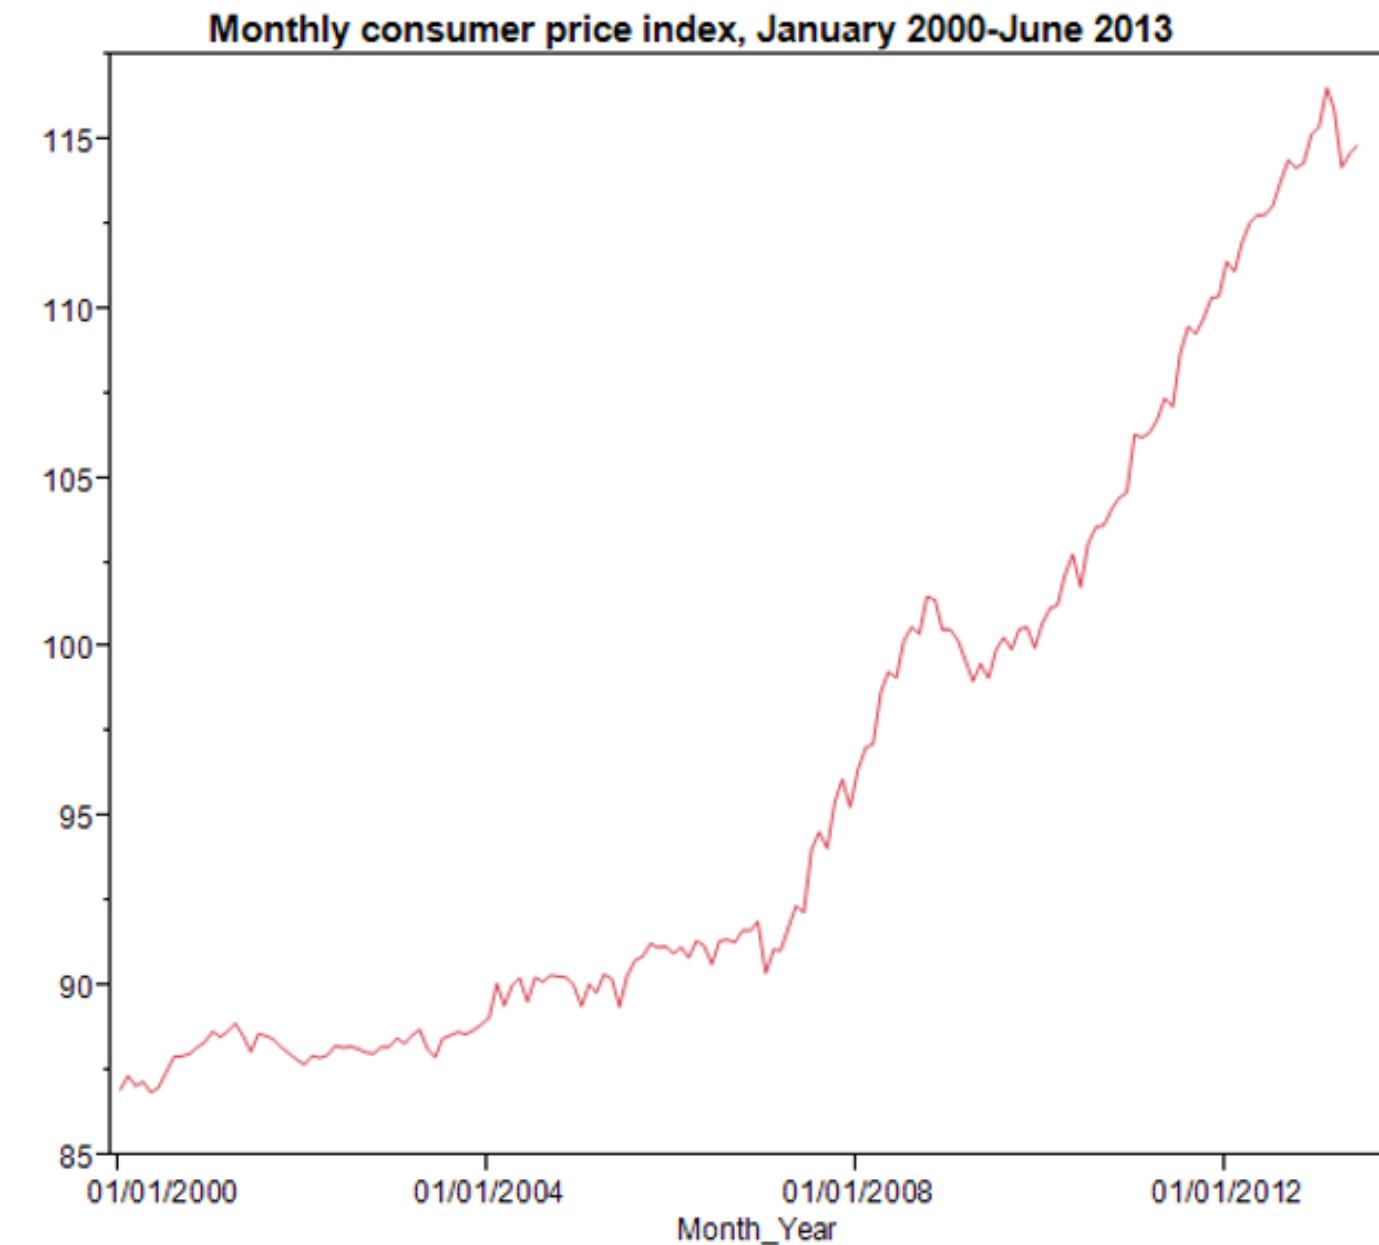

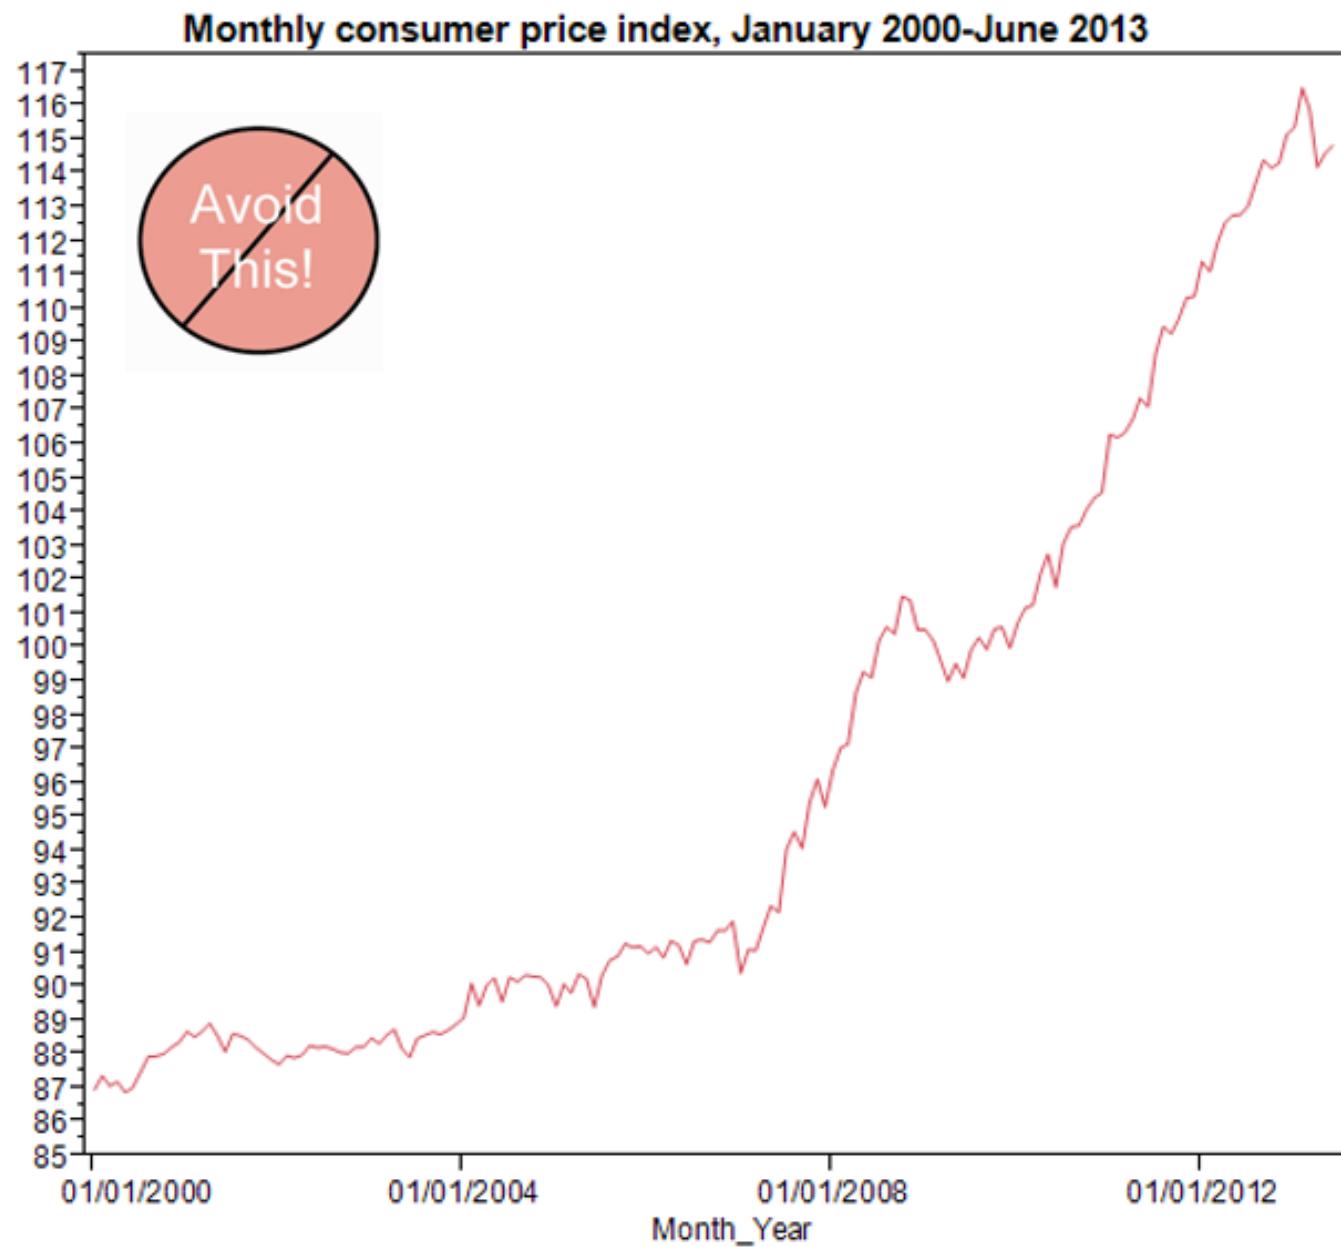

When you shouldn't eliminate tick mark?

Tick marks are necessary on continuous scale.

How many tick marks should you use?

- There is no exact number that works best in all circumstances, and the size of the graph is a factor that must be considered: the longer the scale line, the more tick marks it should contain.

When can you eliminate legends?

- In this graph, a legend is used to indicate product types.

In this graph, product types are labeled directly.

An enlightening data visualisation will be incomplete without a well worded title

- More example can be found [here](#)

Using Annotation to tell data story

How Britons spend their time at weekends vs weekdays

Share of people doing specific activities during **weekends** vs **weekdays**, by time of day (%)

Source: [The truth about weekend working](#), Financial Times, January 23 2020.

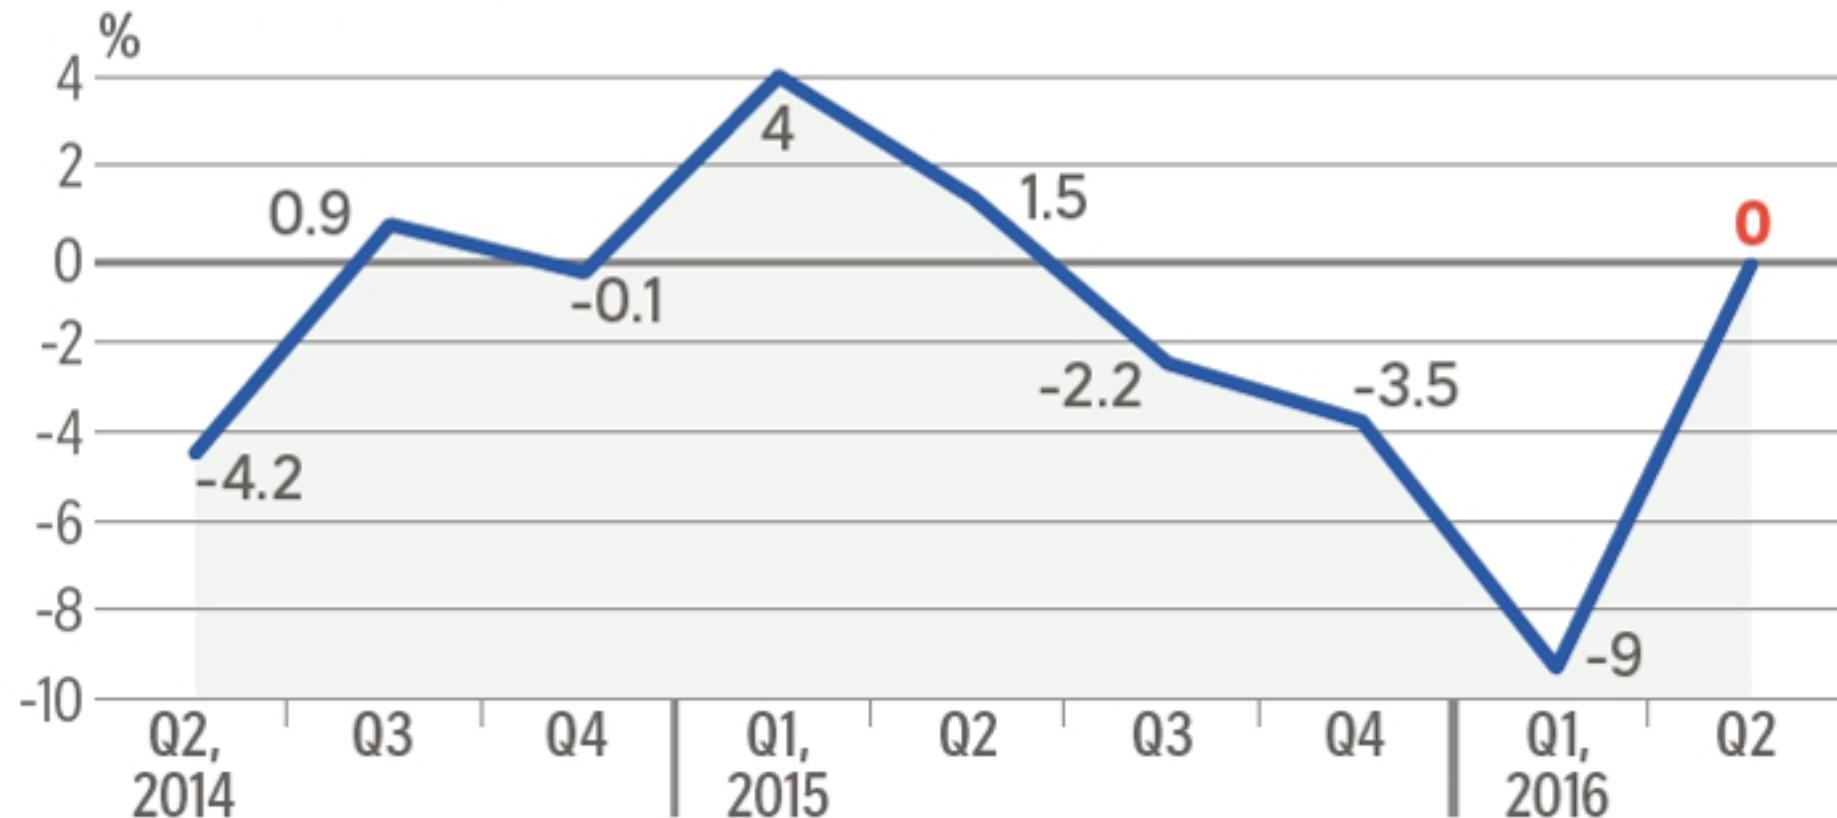

Graphical Integrity: Show Me the Truth

Don't lie to yourself (or to others) with charts

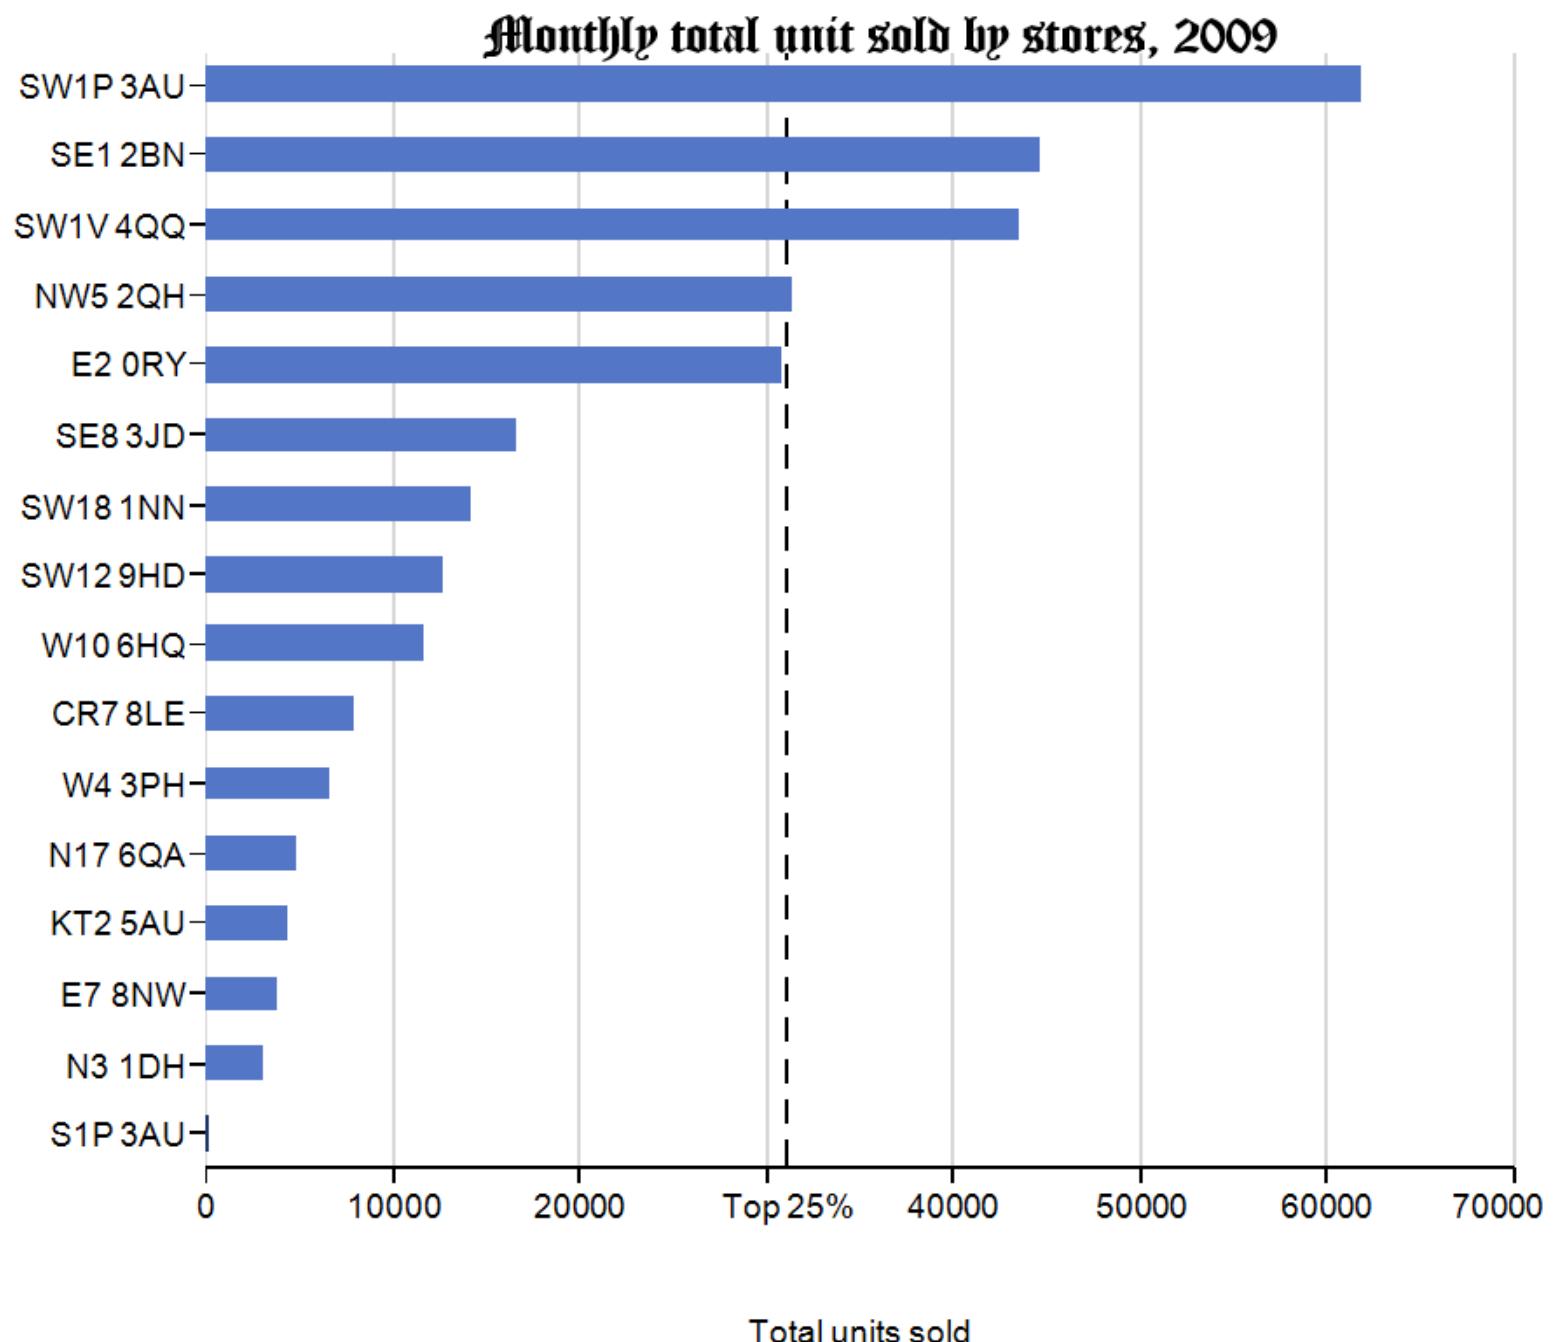

Non-oil domestic exports (Nodx) growth was flat in the second quarter. For the first half this year, **Nodx fell 4.5 per cent** compared with the same period last year.

Stuttering Nodx performance

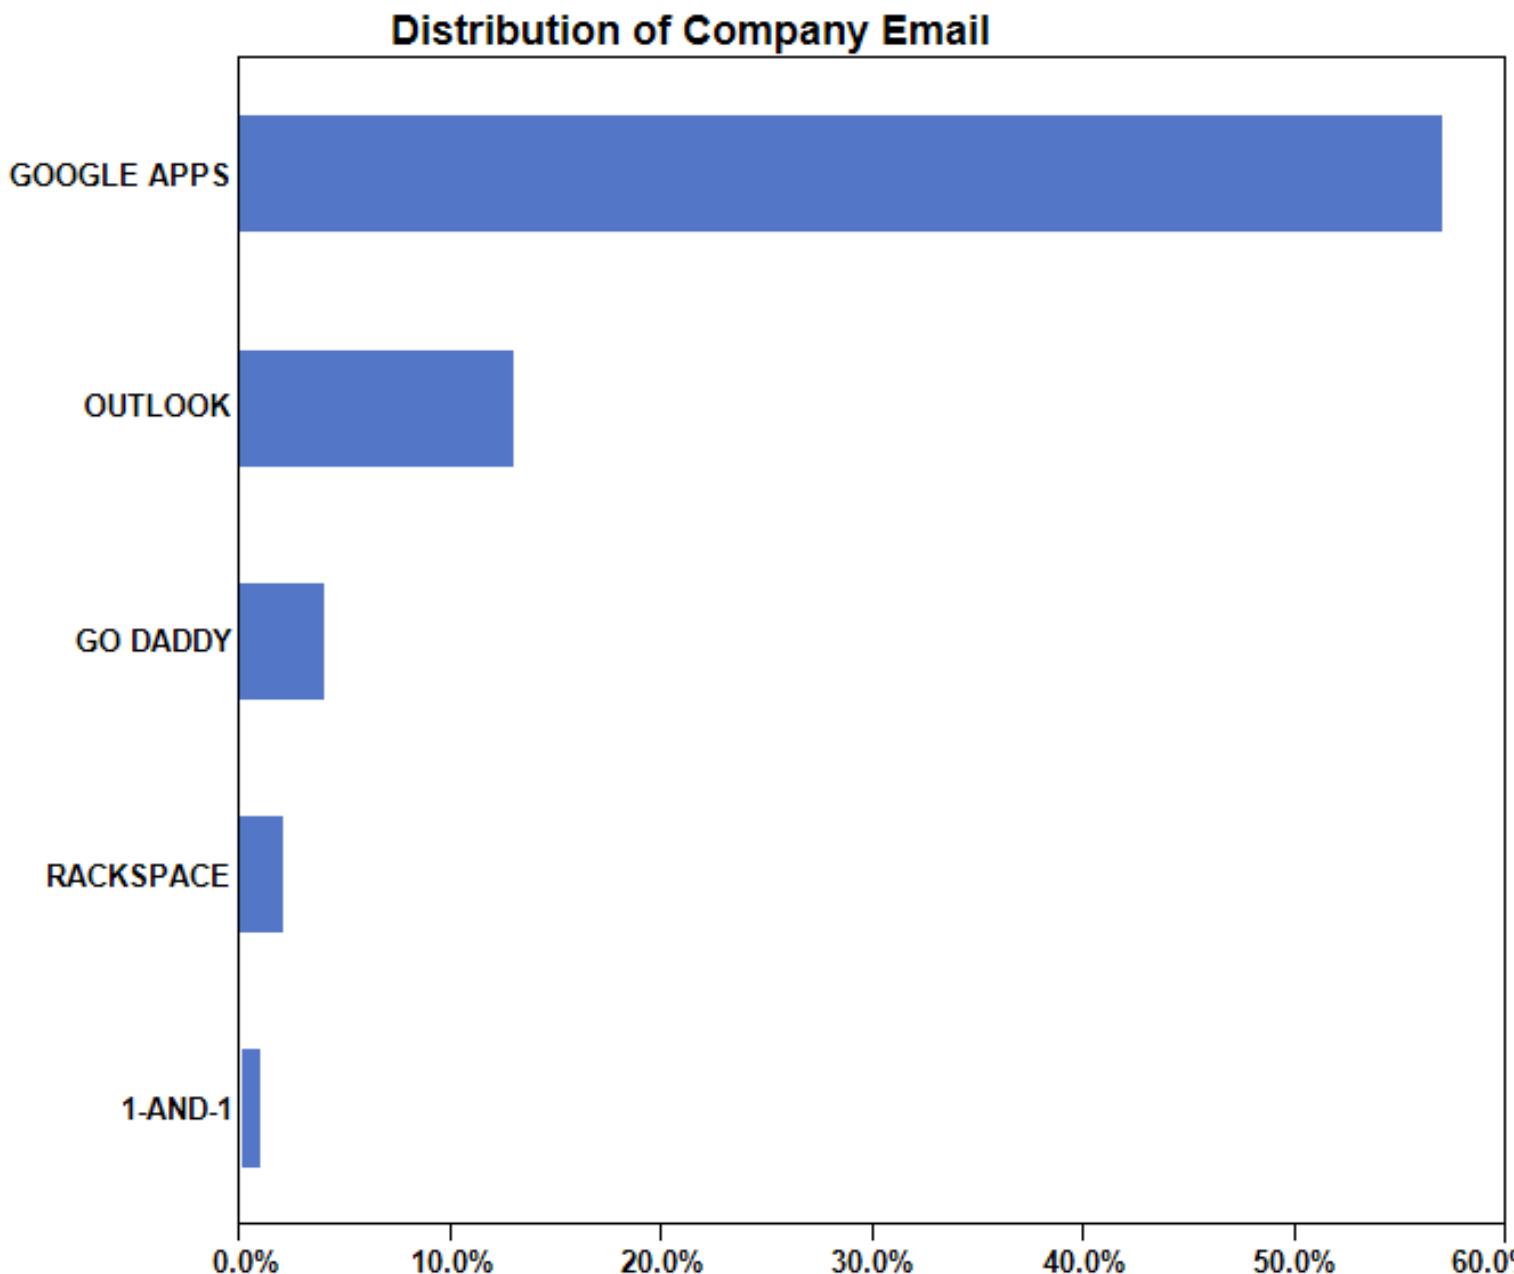

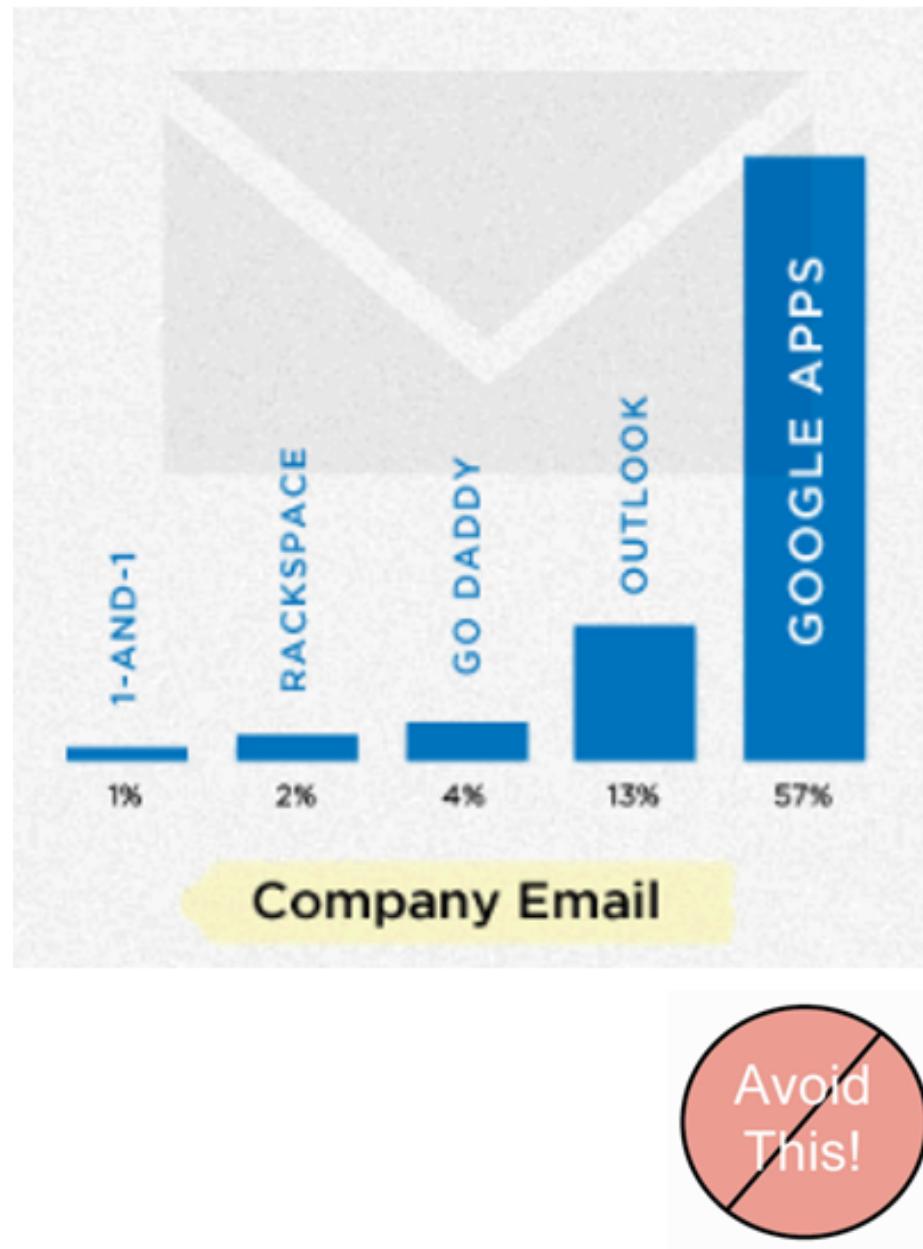

Graph typography

Avoid using artistic fonts

Graph Labeling

Orientation of label should be reader friendly

Three Bugs of Charts Interpretation

- The **Patternicity** bug: We detect interating patterns, regardless of whether or not they are real.
- The **Storytelling** bug: We immediately come up with a coherent explanation for those patterns.
- The **Confirmation** bug: We start seeing all further information we receive, even the one that conflicts with our explanation, in a way that confirmed it. We refuse to give our explanation up, no matter what.

Three Bugs example

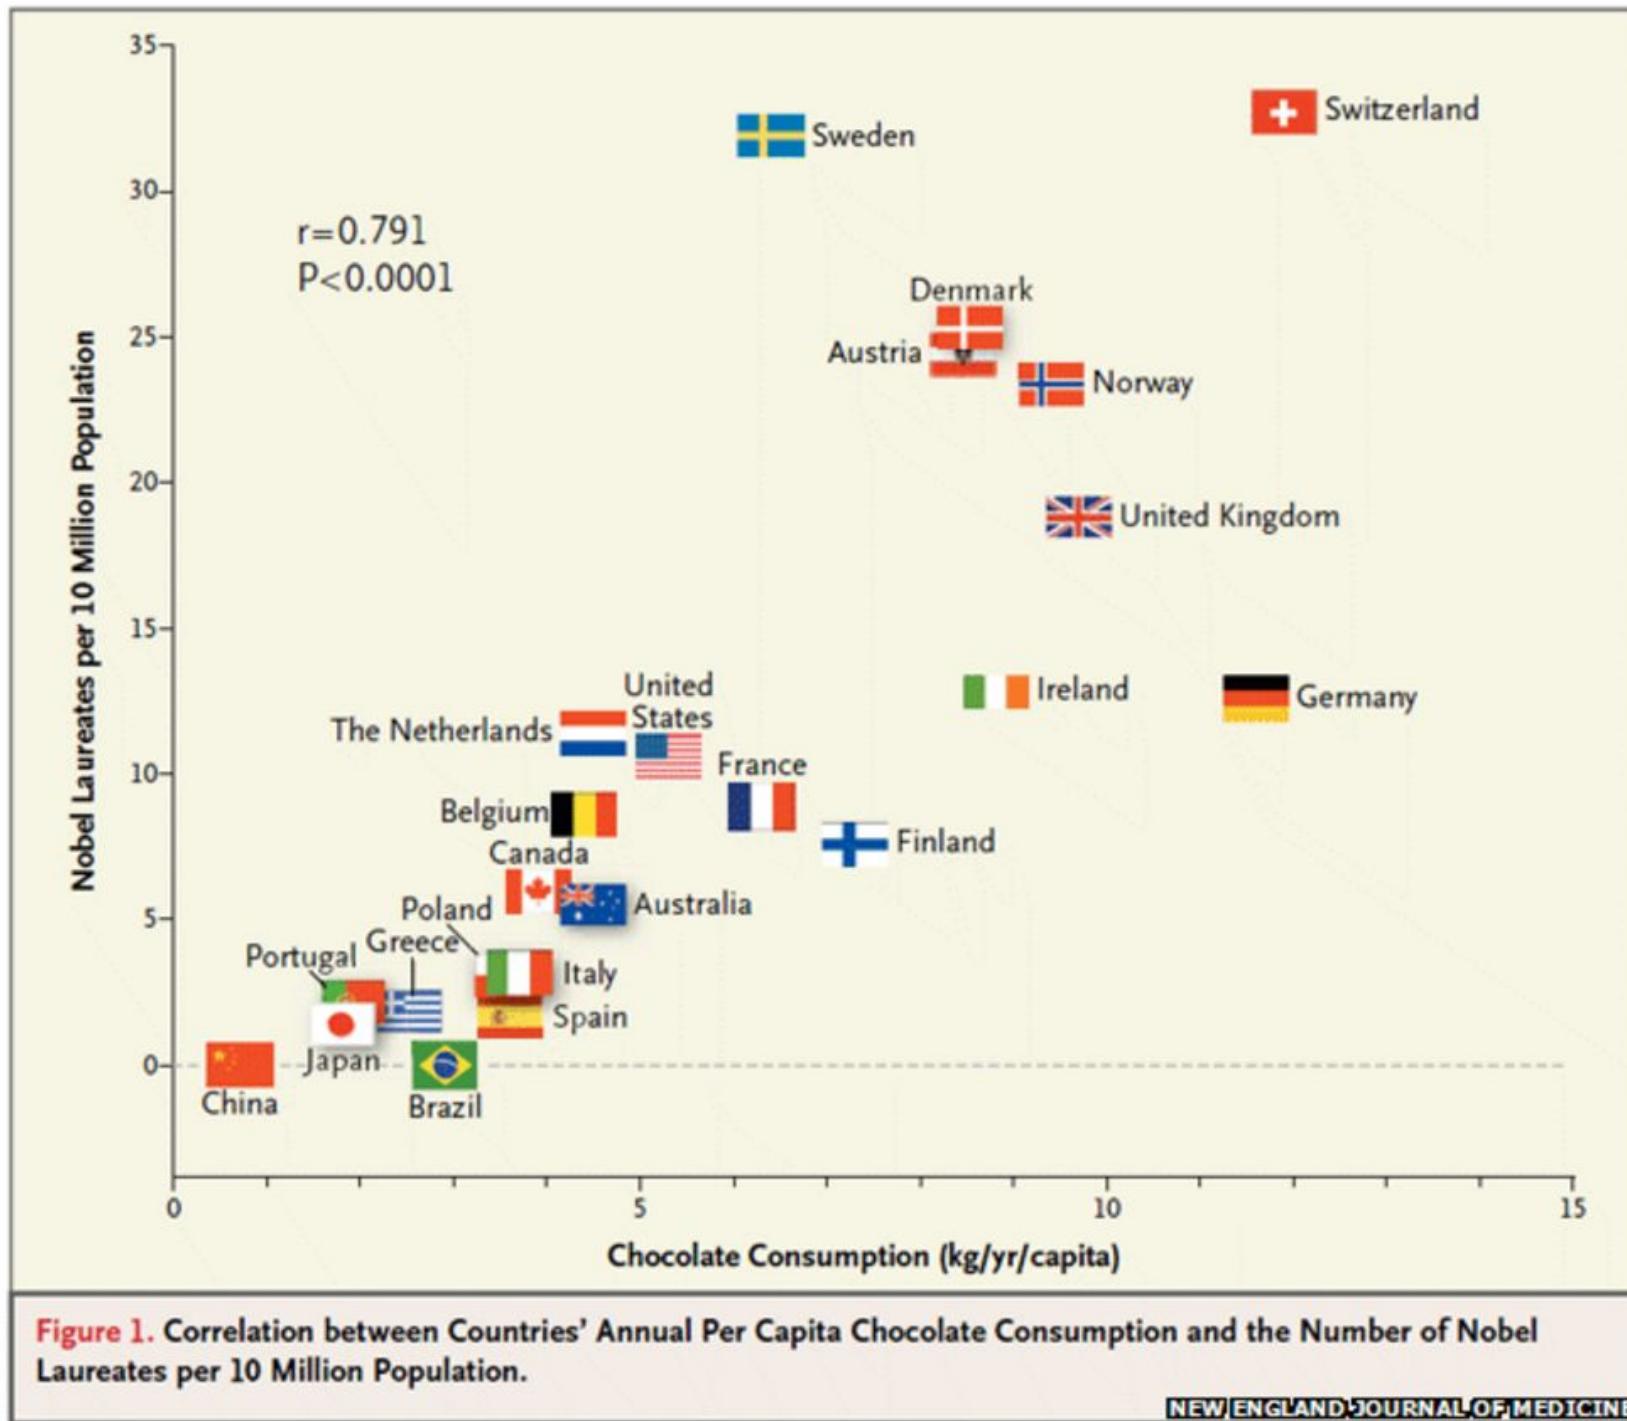

US spending on science, space, and technology
correlates with
Suicides by hanging, strangulation and suffocation

Data Visualization: Clarity or Aesthetics?

Mapping data visualizations on a Cartesian coordinate system where "clarity" is placed along the horizontal (x) axis and "aesthetics" is placed along the vertical (y) axis provides a framework to gage the objective and subjective merits of a graphic:

Source: [Data Visualisation: Clarity or Aesthetics](#)

A Tale of Four Quadrants

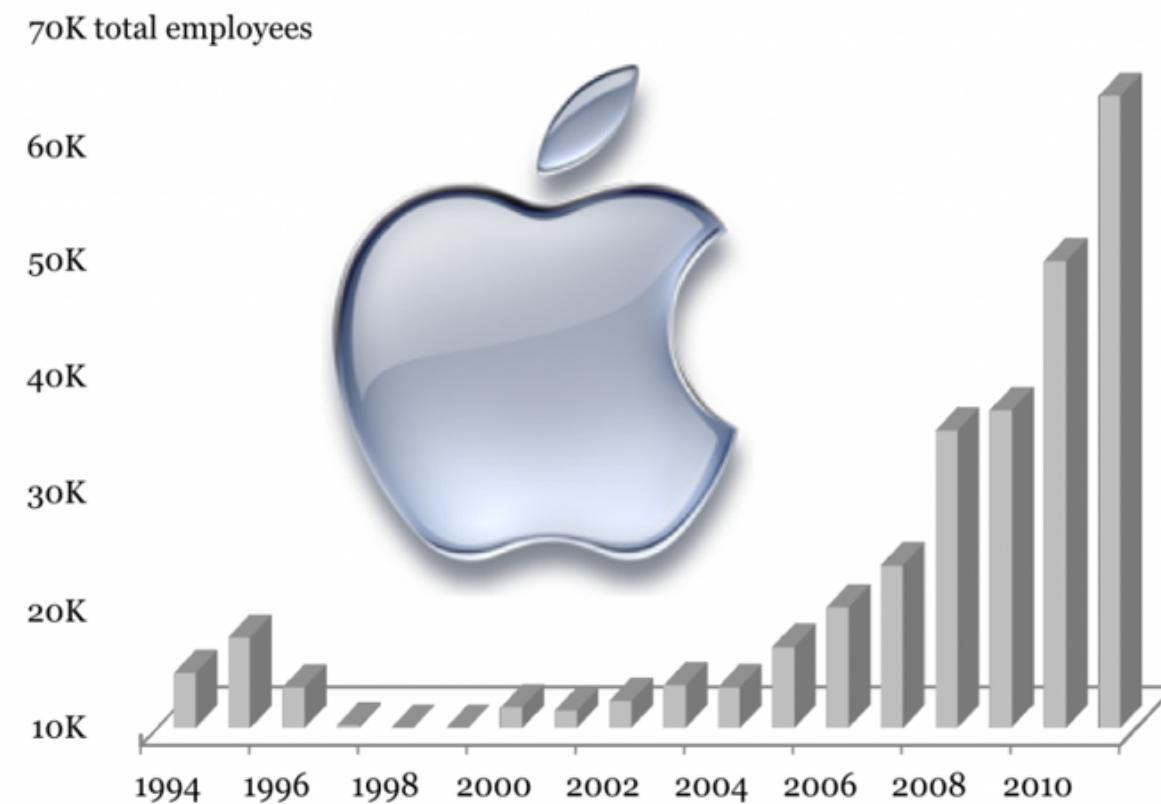

Quadrant IV – Confusing yet Beautiful

- Why is it “beautiful”?
 - Well placed & aligned title & lead-in.
 - Attention to detail with font selection.
 - Inclusion of image.
- Why is it “confusing”?
 - Y-axis starts at 10K (column height misleading).
 - 3D effect makes it difficult to gage heights.
 - Title & lead-in aren’t helpful.

Apple Employment History

Employment at the Cupertino tech giant has skyrocketed over the past 17 years. While a lot of time and attention was paid to design choices like fonts on this chart, it doesn't really help you figure out what's going on. And the column heights are downright misleading

Quadrant III – Confusing and Ugly

- Why is it “ugly”?
 - Horrible font & color choice.
 - Grid lines are too dark & distracting.
 - Format of axes (vertical x-axis labels, number format of y-axis).
- Why is it “confusing”?
 - Y-axis starts at 10K (column height misleading).
 - 3D effect makes it difficult to gage heights.
 - No lead-in or call-outs to provide context.

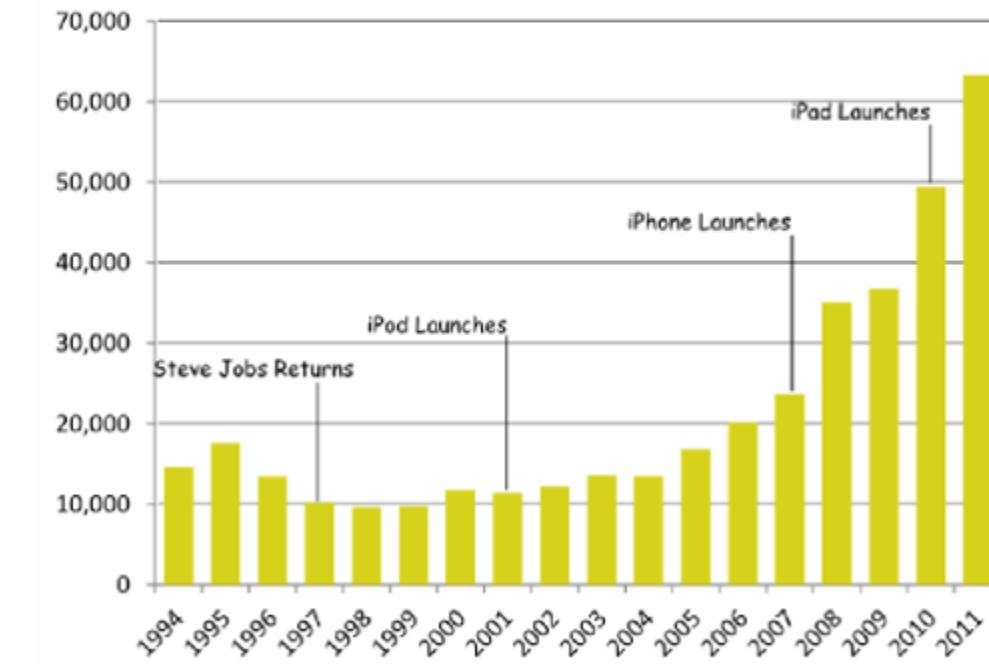

Quadrant II – Clear but Ugly

- Why is it “ugly”?
 - Poor color (puke yellow?) and font (Comic Sans?) choices.
 - Slightly pixelated – poor attention to image quality detail.
 - Chart details – axis orientation, grid lines, outline.
- Why is it “clear”?
 - The y-axis starts at 0 and the 2D columns are easy to gage.
 - For the first time, we see call-outs of relevant events on the timeline.
 - This time the lead-in paragraph is actually informative.

Total Apple Employees

See how Steve Jobs's return to Apple was followed by innovative product launches and growth in employment

Quadrant I – Clear and Beautiful

- Why is it “beautiful”?
 - Good font & color choices throughout.
 - Soft gridlines don’t distract.
 - All elements well aligned and spaced.
 - High res images are “useful” chartjunk.
- Why is it “clear”?
 - The y-axis starts at 0 and the 2D columns are easy to gage.
 - Call-outs with images aid cognition.
 - Improved title & lead-in verbiage provide further elucidation.
 - For the first time, a photo credit and data source are included.

Apple, Inc. Employment History, 1994 - 2011

Between the return of Steve Jobs in 1997 and his death in 2011, Apple grew from 10,000 employees to over 63,000. A look at the timeline shows how key product launches fueled this growth:
